# Table of Contents

Brief Table of Contents.....	vi
Preface.....	xv
List of Figures.....	xvi
Acknowledgements.....	xviii
Chapter 1 - Overview.....	1
About this Workbook.....	1
Why an OER workbook on non-free Stata?.....	1
How to Use this Workbook.....	2
Faculty.....	2
Student.....	2
Your Feedback.....	3
Chapter 2 – Stata Software Tour and Getting Started.....	4
About.....	4
Estimated Time.....	4
Tour of Stata Interface.....	4
Mini-Assignment #1: Instructions.....	6
Step 1: Watch Tour of the Stata interface - YouTube.....	6
Step 2: Share two parts you found interesting.....	6
Mini-Assignment #1: Rubric.....	6
Getting Started in Stata.....	7
Find Data to Import.....	7
Import Data into Stata.....	9
Review the Data in Stata.....	11
Describe the Data.....	13
Mini-Assignment #2: Instructions.....	14
Step 1: Watch What's it like–Getting started in Stata - YouTube.....	14
Step 2: Share two parts you found interesting.....	14
Mini-Assignment #2: Rubric.....	14

Chapter 3 - Datasets: Cross-section, Time Series, and Panel .....	15
About .....	15
Estimated Time .....	15
Cross-Sectional dataset .....	16
Time Series dataset .....	16
Panel dataset .....	17
Mini-Assignment #1: Instructions.....	18
Step 1: Select 1 dataset type that interests you.....	18
Step 2: In 4 or more sentences, explain why you selected this dataset type.....	18
Mini-Assignment #1: Rubric .....	18
Chapter 4 - Data Management .....	20
About .....	20
Estimated Time .....	20
Big Picture.....	20
Storing Data.....	21
Sourcing Data.....	22
Non-academic example of using an existing dataset.....	23
Academic example of creating a new dataset and using an existing dataset. ....	23
Folders.....	24
Files .....	24
Version Control .....	25
Folder Structure .....	26
File Naming .....	27
Base Dataset.....	28
Variable Data.....	30
Existing Dataset.....	30
Creating a New Dataset.....	30
Mini-Assignment #1: Instructions.....	33
Step 1: Declare a research question. ....	33

Step 2: Declare an independent variable (aka explanatory variable aka cause) that is derived from your research question.....	33
Step 3: Declare a dependent variable (aka outcome variable aka effect) that is derived from your research question.....	33
Step 4: Declare at least 3 search terms.....	33
Mini-Assignment #1: Rubric.....	33
Chapter 5 - Descriptive Statistics.....	34
About.....	34
Estimated Time.....	34
How do I produce descriptive statistics in Stata?.....	34
Part 1: Import dataset into Stata.....	34
Part 2: Describe the dataset.....	35
Part 3: Summarize all variables.....	37
Part 4: Tabulate variables one-by-one.....	39
Mini-Assignment #1: Instructions.....	41
Step 1: Select two parts of the four-part descriptive statistics process.....	41
Step 2: Explain in 2 or more sentences how the two parts are related to each other.....	41
Step 3: Explain in 2 or more sentences what is unclear to you about one of the two parts you selected.....	41
Mini-Assignment #1: Rubric.....	41
Chapter 6 - Model Selection.....	42
About.....	42
Estimated Time.....	42
The Research Process.....	42
What is Model Selection?.....	43
Nature of Dependent Variable.....	44
Type of Dataset.....	45
Mini-Assignment #1: Instructions.....	45
Step 1: Select one of the 1 of the 10 model options.....	45
Step 2: Explain in 2 or more sentences why you selected the model you chose.....	46
Mini-Assignment #1: Rubric.....	46

Chapter 7 - Linear Models .....	47
About .....	47
Estimated Time .....	47
How do I run a linear model in Stata using political science data? .....	47
Step-by-Step Walkthrough.....	48
Mini-Assignment #1: Instructions.....	51
Step 1: Select a 3-step sequence subset from the 19-step process above that you find most interesting. ....	51
Step 2: Explain in 6 or more sentences why you selected this specific 3-step sequence. ....	51
Mini-Assignment #1: Rubric .....	51
Chapter 8 - Binary Outcome Models .....	52
About .....	52
Estimated Time .....	52
How do I run a binary outcome model in Stata using political science data? .....	52
Step-by-Step Walkthrough.....	52
Mini-Assignment #1: Instructions.....	55
Step 1: Select a 3-step sequence subset from the 21-step process above that you find most interesting. ....	55
Step 2: Explain in 6 or more sentences why you selected this specific 3-step sequence. ....	55
Mini-Assignment #1: Rubric .....	55
Chapter 9 - Ordinal Outcome Models .....	56
About .....	56
Estimated Time .....	56
How do I run an ordinal outcome model in Stata using political science data? .....	56
Step-by-Step Walkthrough.....	56
Mini-Assignment #1: Instructions.....	61
Step 1: Select a 3-step sequence subset from the 16-step process above that you find most interesting. ....	61
Step 2: Explain in 6 or more sentences why you selected this specific 3-step sequence. ....	61
Mini-Assignment #1: Rubric .....	61
Chapter 10 - Categorical Outcome Models.....	62

About .....	62
Estimated Time .....	62
How do I run a categorical outcome model in Stata using political science data?.....	62
Step-by-Step Walkthrough.....	62
Mini-Assignment #1: Instructions.....	68
Step 1: Select a 3-step sequence subset from the 18-step process above that you find most interesting. ....	68
Step 2: Explain in 6 or more sentences why you selected this specific 3-step sequence. ....	68
Mini-Assignment #1: Rubric .....	68
Chapter 11 - Count Outcome Models.....	69
About.....	69
Estimated Time .....	69
How do I run a count outcome model in Stata using political science data?.....	69
Step-by-Step Walkthrough.....	69
Mini-Assignment #1: Instructions.....	73
Step 1: Select a 3-step sequence subset from the 17-step process above that you find most interesting. ....	73
Step 2: Explain in 6 or more sentences why you selected this specific 3-step sequence. ....	74
Mini-Assignment #1: Rubric .....	74
Chapter 12 - Panel Data Linear Models.....	75
About.....	75
Panel Data: Multiple Objects across Multiple Time Periods .....	75
Time-variant and time-invariant .....	75
Estimated Time .....	76
How do I run a panel data linear model in Stata using political science data? .....	76
Step-by-Step Walkthrough.....	76
Mini-Assignment #1: Instructions.....	81
Step 1: Select a 3-step sequence subset from the 16-step process above that you find most interesting. ....	81
Step 2: Explain in 6 or more sentences why you selected this specific 3-step sequence. ....	81
Mini-Assignment #1: Rubric .....	81

Chapter 13 - Panel Data Binary Outcome Models.....	82
About.....	82
Estimated Time.....	82
How do I run a panel data binary outcome model in Stata using political science data?.....	82
Step-by-Step Walkthrough.....	82
Mini-Assignment #1: Instructions.....	85
Step 1: Select a 3-step sequence subset from the 14-step process above that you find most interesting. ....	85
Step 2: Explain in 6 or more sentences why you selected this specific 3-step sequence. ....	85

# Preface

When I was a first-generation student at community college, I never heard of [Stata](#) or any other statistical and data analysis software. I had a challenging enough time in my computer programming, statistics, and calculus courses during my first two years, that having a professor try to teach me about such data analysis software would likely have gone in one ear and out the other ear.

Once I transferred to [UC Merced](#), I was introduced to Stata in my econometrics (think economics and statistics) course. I earned a D+ in that course because I was confused by the underlying mechanics of the best, linear, unbiased estimate (good old “BLUE”) and having to use Stata. Also, I spent time organizing California Students for Barack Obama during spring 2007, so my attendance in econometrics was not consistent.

I ended up successfully retaking econometrics at Sacramento State after my employer, Lieutenant Governor John Garamendi, told me that I needed to finish my bachelor’s degree. I did not mention this in the prior paragraph, but that D+ needed to be a C- so the course would count towards my graduation requirements. While it cost me about \$500 to retake the course, I was able to leave work early on Tuesdays and Thursdays so I could drive from downtown to the university campus.

Once I started working in the [U.S. House of Representatives](#), I encountered more reports with data analysis. A practical link was established after I met with representatives of the [RAND Corporation](#) to learn more about reports they published. That is when I realized the utility of my econometrics training and it’s real-world application to public policy.

I left my real-world career as a congressional policy advisor and returned to UC Merced to start the [political science Ph.D. program](#). I was confronted with data analysis again, and I struggled so much that I had to retake the whole core methods sequence during my second year in the program; this was not a small setback, as it consisted of 3 courses. I powered through and successfully completed the quantitative analysis-rich program. I resolved that when I became a professor, I would work to introduce my mostly first-generation community college students to statistical and data analysis software. And so, Polimetrics is a result of that resolve.

Josh Franco, Ph.D.

April 2021

# Acknowledgements

Thank you to my wife Mayra and son Ethan for letting me have time to work on this workbook over the last year.

Thank you to Gabriela Ortiz, Applied Econometrician at StataCorp, for reviewing a draft of this workbook and providing insightful comments and feedback.

Thank you to Alexandra Alcantara, Daniel Amodeo-Chavez, Lava Khurshid, Octavio Vicencio, and James Zillo from my spring 2020 Introduction to Political Science Research Methods. They were, and will forever be, the inaugural political science research methods student at Cuyamaca College. They got the kernel of this workbook rolling since we worked with Stata until the COVID-19 pandemic resulted in stay-at-home orders in March 2020.

# Chapter 1 - Overview

## About this Workbook

Polimetrics is designed as a companion to *Introduction to Political Science Research Methods, 1<sup>st</sup> Edition*, or IPSRM for short.

I co-authored IPSRM, which is an Open Education Resource textbook as well, with my colleagues Dr. Charlotte Lee at Berkeley City College, Kau Vue at Fresno City College, Dr. Dino Bozonelos at Victor Valley College, Dr. Masahiro Omae at San Diego City College, and Dr. Steven Cauchon at Imperial Valley College.

Visit <https://ipsrm.com/> to download your PDF copy of IPSRM 1<sup>st</sup> edition.

This workbook provides a tour of the Stata software, an introduction to cross-sectional, time series, and panel data, and an introduction to a variety of models. We review models where the outcome is linear, binary, ordinal, categorical, and count. Additionally, we have an interpretation chapter on survival models.

Each “Models” chapter has a similar organizational structure: about, estimated time, what is the model, how are models run in Stata, how do we interpret the model results, and a real-world example of model results in a Creative Commons licensed, peer-reviewed journal article. Additionally, mini-assignment instructions and a rubric will be included so students can practice their interpretation skills.

## Why an OER workbook on non-free Stata?

Open Education Resources, by definition, are free in electronic form. This means this Workbook is free. However, Stata costs money. For students, you can [buy](#) a 6-month license of Stata/IC (entry-level) for \$48, an annual license for \$94, and a perpetual (aka lifetime) license for \$225. For teachers, a Stata/IC annual license is \$125, and a 3-year license is \$365.

I prefer Stata to [RStudio](#) (which is free) because of syntax. There are simply fewer characters to type when using Stata versus RStudio. And fewer characters to type means fewer syntax errors. And fewer syntax errors mean less frustration for the beginning user, which is my target audience.

Relatedly, I took two computer programming classes when I was in community college: BASIC and C++. Both were difficult, because I did not understand at the time, that I was learning a language, logic, and

36 mathematics simultaneously. Therefore, I prefer not to conflate the learning of how to interpret the  
37 results of statistical and data analysis models with programming syntax-heavy software.

38

## 39 **How to Use this Workbook**

40 This workbook has two audiences: faculty and students. Below I describe how to use this workbook from  
41 each perspective.

42

### 43 **Faculty**

44 From the faculty perspective, this workbook serves as an unpretentious introduction to Stata targeted for  
45 first-year or second-year college-level students. As I mentioned in the Preface, when I was a community  
46 college student, I never heard of Stata or any other statistical and data analysis software. But, in  
47 retrospect, I would have benefitted from knowing about, being explained its utility, and letting that  
48 knowledge inform my journey.

49

50 This Workbook does not cover the underlying mathematics or statistics of these models: no expressions,  
51 no equations, and no proofs. If I feel the need, the need for mathematical expressions, then I will relegate  
52 it to a footnote and citation for self-exploration. I use plain language to communicate seemingly complex  
53 concepts because statistical and data analysis should be accessible to anyone, not just those attending or  
54 working in the proverbial ivory tower.

55

56 Faculty who are teaching an introductory level course in research methods or statistics are encouraged to  
57 use this Workbook, since it dovetails nicely with increasing students' awareness and knowledge of  
58 statistical and data analysis software, like Stata.

59

60 I think chapter 2 (Software Tour and Getting Started) and chapter 3 (Datasets) are necessary for clearly  
61 orientating a student. From there, you can pick and choose which Models chapters you want to explore  
62 with your students. Each Model is based on the dependent variable, or outcome variable, of interest. For  
63 example, if you and your students are exploring why someone votes or not, this is a binary outcome,  
64 meaning you should use chapter 8 (Binary Outcome Models). Of, if you and your students are exploring  
65 the length of time it takes a student to earn their Associates degree, then chapter 17 (Survival Models)  
66 can be utilized.

67

### 68 **Student**

69 I will forever be a first-generation, community college student. I decided to attend college because I  
70 believed it offered me a path for a better life. And it has.

71

72 This Workbook is designed for you: the new college student who is starting their adult life or the  
73 returning college student who wants to live a better life for themselves and their family. I bridge theory  
74 with practice, having worked in government and politics for five years before earning my Ph.D. I hope  
75 that comes through in each chapter, so that your honest “Why does this matter?” question has an  
76 answer for it.

77

78 Also recall that each “Models” chapter has a similar organizational structure: about, estimated time,  
79 what is the model, how are models run in Stata, how do we interpret the model results, and a real-world  
80 example of model results in a Creative Commons licensed, peer-reviewed journal article. Additionally,  
81 mini-assignment instructions and a rubric will be included so you can practice your interpretation skills.

82

83 This similar organizational structure should help you develop a rhythm as you work your way through  
84 chapters assigned by your professor, or that you are discovering on your own.

85

## 86 **Your Feedback**

87 I would appreciate feedback that you have for me regarding this Workbook, so feel free to send me an  
88 email at [josue.franco@gcccd.edu](mailto:josue.franco@gcccd.edu).

89

90 If you find a spelling error, send me an email. If you think something is poorly written, send me an  
91 email. If you believe I do not explain something well enough, send me an email. If you think everything  
92 is great, send me an email.

93

# Chapter 2 – Stata Software Tour and Getting Started

## About

Stata is statistical and data analysis software. According to [Stata](#), “In January 1985, Stata 1.0 was released. In June 2019, Stata 16 was released. For over thirty years, StataCorp has been a leader in statistical software, dedicated to providing the tools professional researchers need to analyze their data.” Stata even has a [Political science | Stata](#) webpage.

Software is a computer program that you install on your computer. Software is commonly called “apps” these days. Much like you would download apps, like Facebook app or Discord app, you can download and install Stata software on your PC or Mac computer.

The purpose of this chapter is to take a brief software tour of Stata, which is the latest version, and explore how to Get Started. I offer a written, truncated version of the Tour and Getting Started below. The Mini-Assignment ask you to watch videos to reinforce what your read.

## Estimated Time

An estimated 90-120 minutes is needed to complete this activity.

## Tour of Stata Interface

We interact with any software using its interface. An interface includes menu bars, panels, and buttons.

Below is a screenshot of the standard Stata user interface. The interface includes seven elements:

1. Top left menu that lists: File, Edit, Data, Graphics, Statistics, User, Window, and Help
2. Top left buttons that include icons for Open, Save, Print, and so on
3. Left Panel labeled “History”.
4. Center top panel, called the “Results” window, that contains output of commands. For example, you can see **update query** in bold, and the following text was produced from that command.
5. Center bottom panel, labeled “Command” window, is where you type Stata commands that produce output. For example, I typed **update query** in this field.

- 125 6. Right top panel, labeled “Variables” window, that list the variables if you had variables defined  
 126 or a dataset loaded.  
 127 7. Right bottom panel, labeled “Properties” window, that provide specific information about  
 128 Variables and Data.

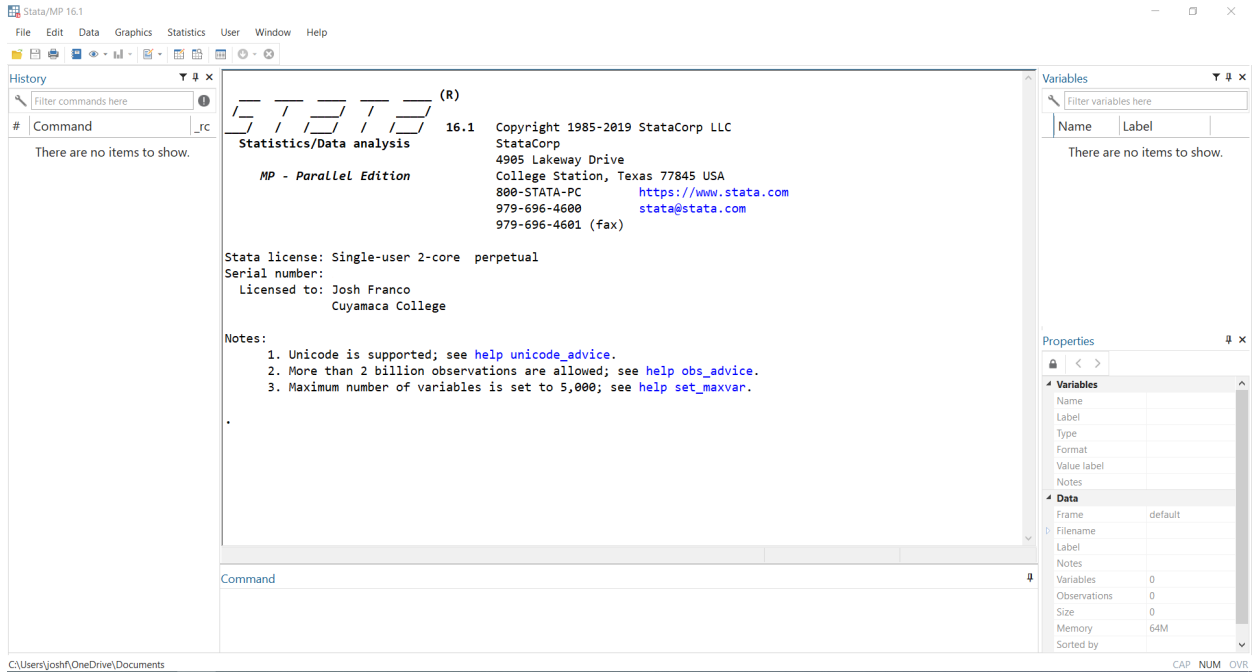

Figure 2-1: User interface of Stata

131  
 132 Now, you might be telling yourself: this is too complicated. Really?

133  
 134 Let us compare Stata to another, more common, user interface: Facebook.com. This interface has six  
 135 elements:

- 136 1. Top Left Search field
- 137 2. Top Center Buttons that include Home, Watch, Marketplace, and so on
- 138 3. Left navigation bar that includes my name, Friends, and so on
- 139 4. Center “What’s on your mind, Josh?” field.
- 140 5. Center Wall or Stream or whatever it is called now.
- 141 6. Right side Birthdays and Contacts

Figure 2-2: User Interface of Facebook.com

142  
 143

144 Both are readily complicated if you are encountering them for the first time. But, if you take a moment to  
 145 see the forest (interface) for the trees (elements of the interface), then it does not seem as complicated, or  
 146 daunting.

147

## 148 **Mini-Assignment #1: Instructions**

149 **Step 1: Watch [Tour of the Stata interface - YouTube](#)**

150 **Step 2: Share two parts you found interesting.**

- 151 • In 4 or more sentences, share what two parts about Stata [Tour of the Stata 16 interface -](#)  
 152 [YouTube](#) you found most interesting and state why.

153

## 154 **Mini-Assignment #1: Rubric**

Criteria	Ratings	Points
Video: 1st Part: Interesting: What	Yes	25
	Missing	0
Video: 1st Part: Interesting: Why	Yes	25
	Missing	0
Video: 2nd Part: Interesting: What	Yes	25
	Missing	0

	Less than 4	0
Quality: Subjective evaluation by Professor	01 – Superb	0
	02 – Excellent	0
	03 – Great	0
	04 – Good	0
	05 – Insufficient	0

155

156

## 157 **Getting Started in Stata**

158 Stata, like any software, offers a host of options. Continuing with our comparison of Stata and  
159 Facebook.com, there are parts of Facebook.com I use all the time, like the scrolling through the Wall or  
160 whatever it is called now. However, there are other parts of Facebook.com that are completely unknown  
161 to me. For example, what is this Gaming button all about?

162

163 Stata has a mountain of features for cutting-edge statistical and data analysis, and importantly for us, has  
164 introductory tools for budding data analysts.

165

### 166 **Find Data to Import**

167 Stata itself has Example datasets that you can import. You can access these example datasets by clicking  
168 on “File” in the Top Left Menu bar and selecting “Example datasets...”

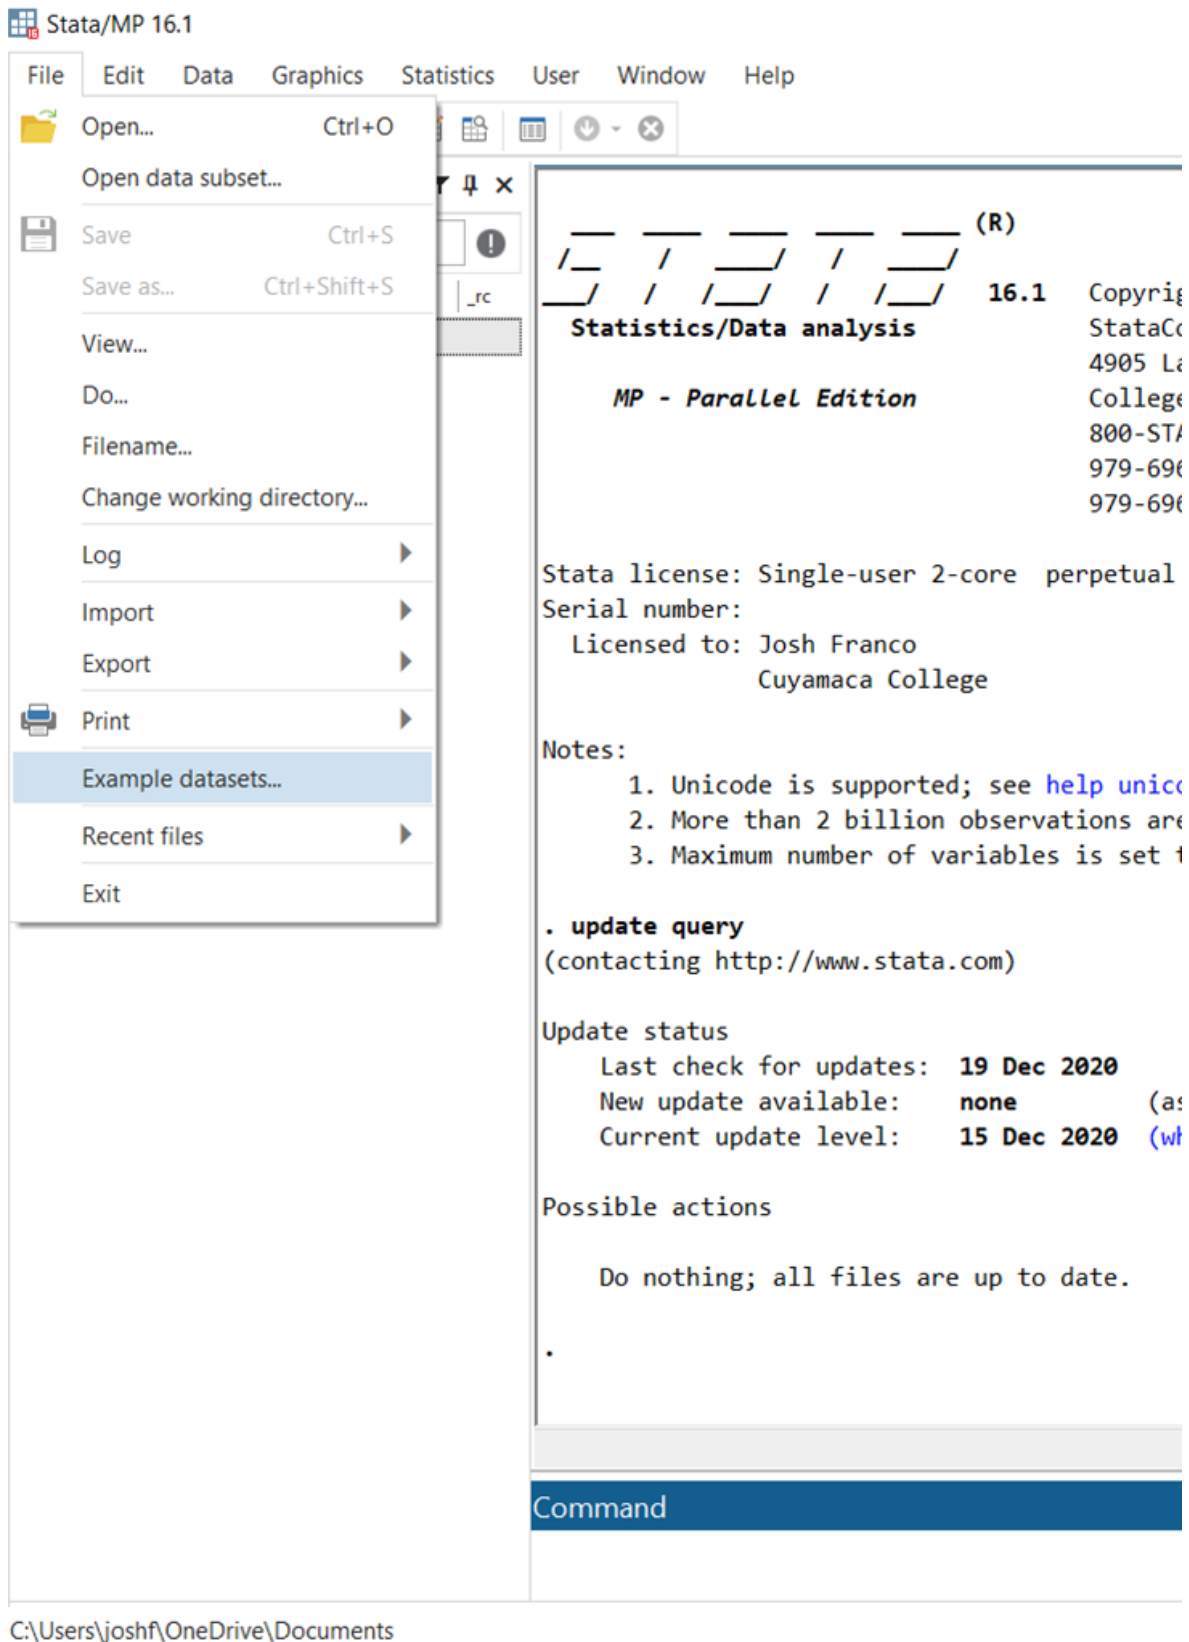

Figure 2-3: Accessing Example Datasets installed with Stata.

171 Finding non-Stata provided data to import can be chore. Where does someone even begin to find such  
172 datasets? Here are at least two repositories of social science related datasets:

- 173 • [Inter-university Consortium for Political and Social Research \(ICPSR\)](#)
- 174 • [The Dataverse Project - Dataverse.org](#)

175

176 I will be utilizing the Public Policy Institute of California (PPIC)'s Statewide Survey Data from 2020  
177 throughout the Workbook.

- 178 • [PPIC Statewide Survey Data - 2020 - Public Policy Institute of California](#)

179

## 180 **Import Data into Stata**

181 I went to [PPIC Statewide Survey Data - 2020 - Public Policy Institute of California](#) and downloaded the  
182 [January 2020 Survey Data](#) and the [May 2020 Survey Data](#).

183

184 Both Survey Data files download as [ZIP \(file format\) - Wikipedia](#). ZIP files allow creators to package and  
185 compress multiple files into a single ZIP files. In other words, ZIP files are like your multiple item  
186 Amazon package that got doubly bubbled wrapped.

187

188 After I download and unzip both files, I find two files: a codebook and .sav file. The codebook I can  
189 readily open using Microsoft Word or some other word processor. However, the .sav file would be tricky  
190 since older versions of Stata could not import this file type. Luckily for us, Stata 16 allows you to import  
191 .sav files and convert them into Stata-native .dta files.

192

193 You can Import these .sav files by clicking on “File” in the Top Left Menu bar and selecting “Import”  
194 then selecting “SPSS data (\*.sav)”. For this example, we will just import the January 2020 Survey Data.

195

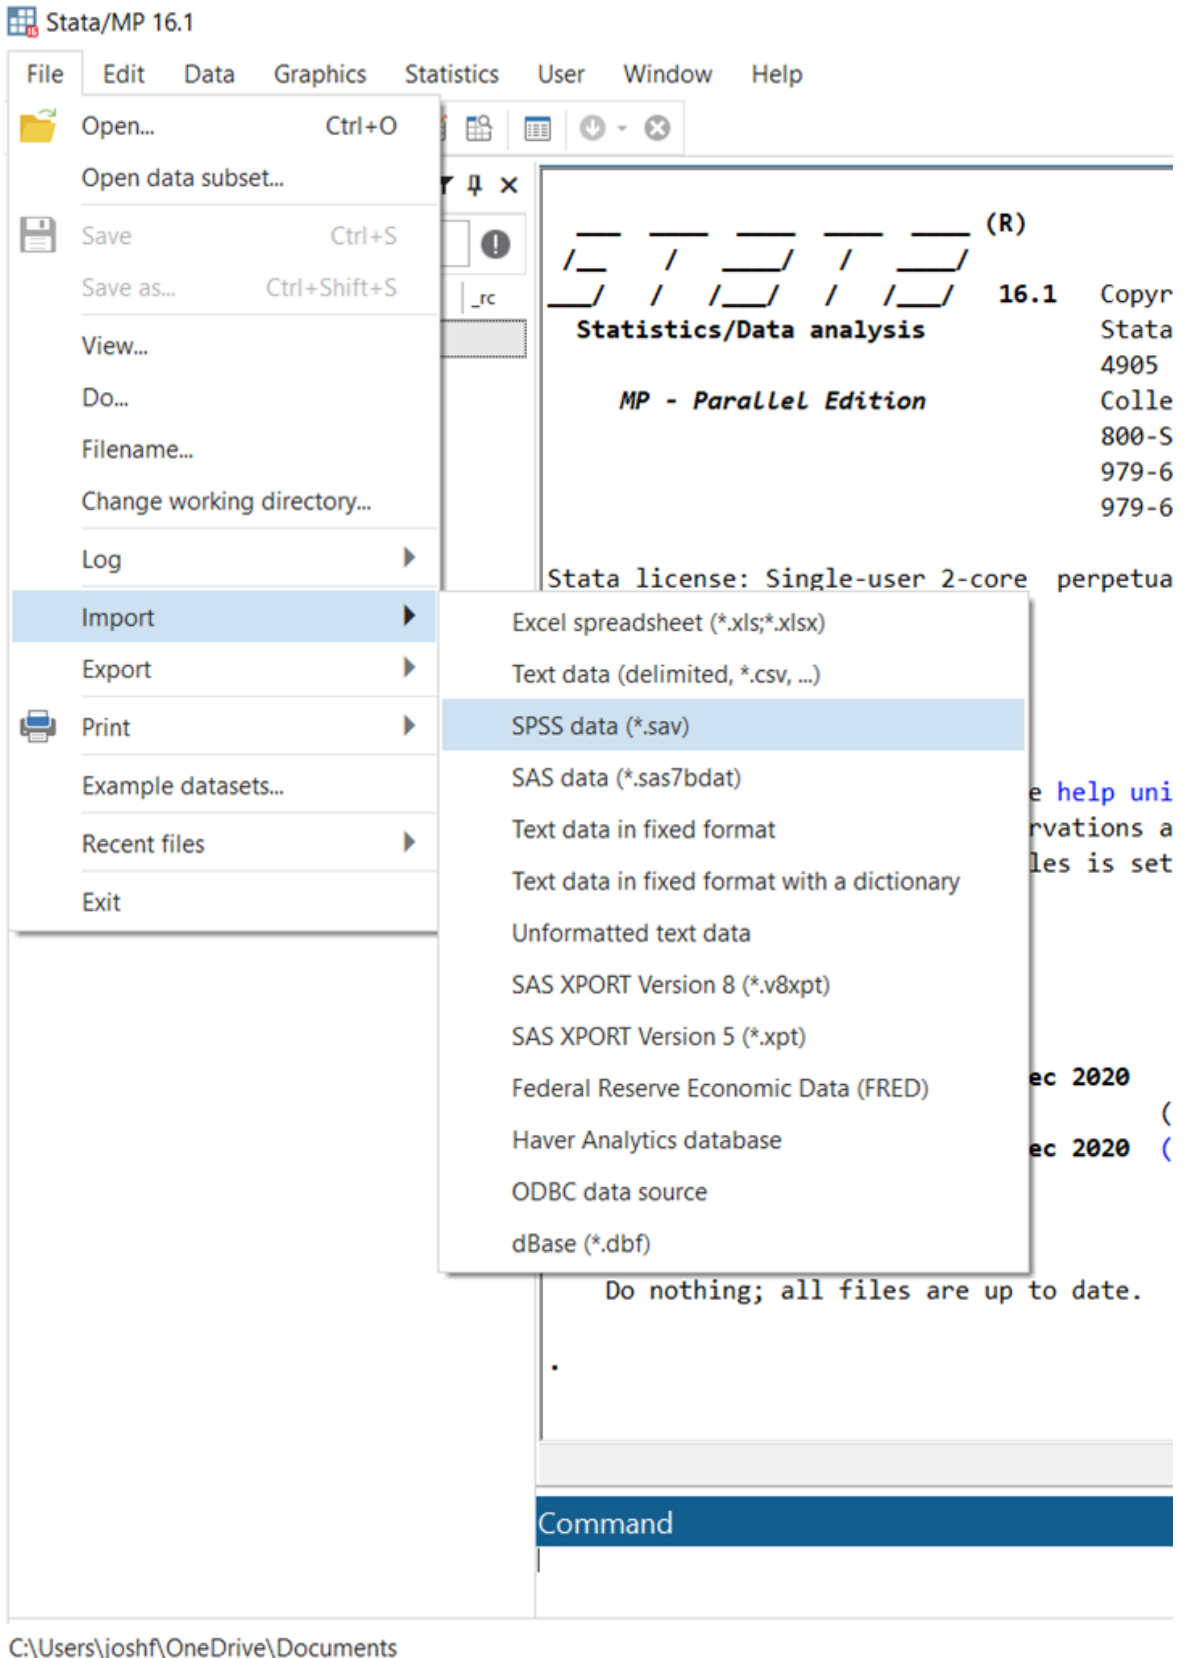

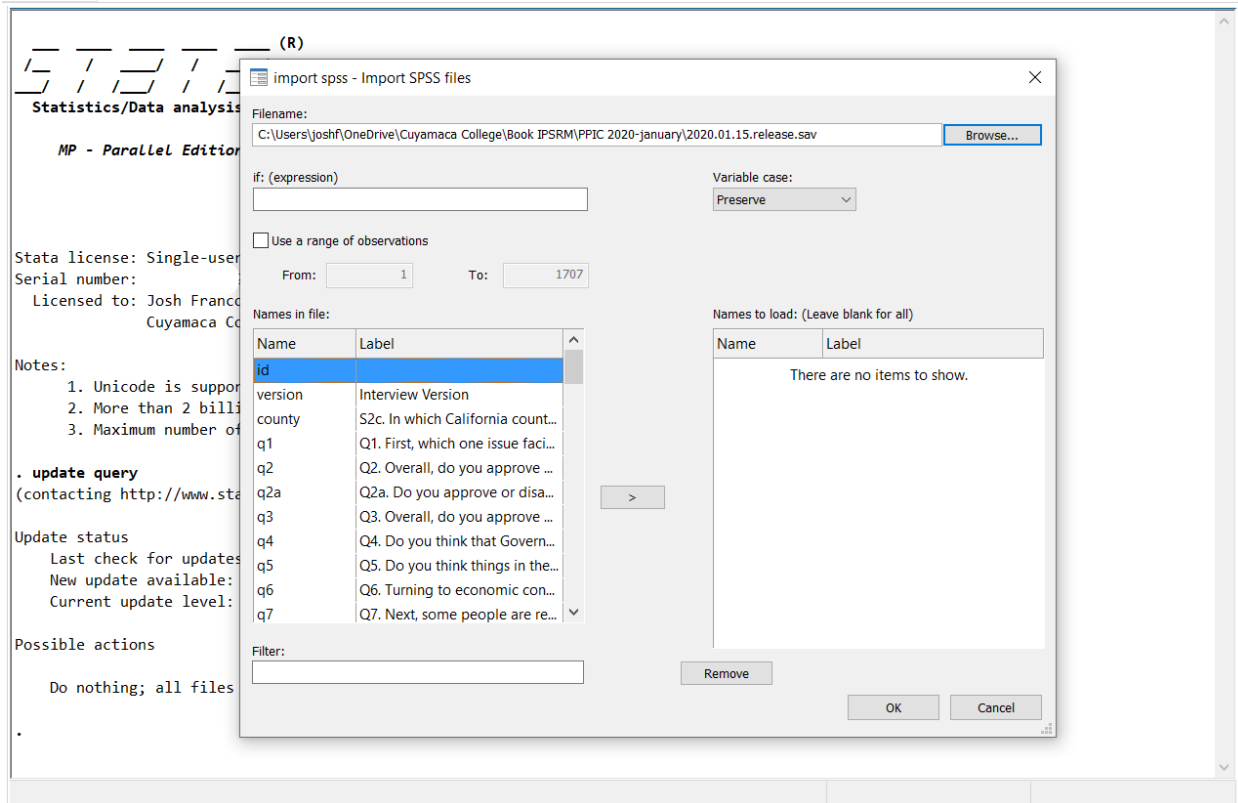

Figure 2-4: Importing a .sav file into Stata.

198

199 A dialog box, or a small popup window, titled “import spss – Import SPSS files” will appear. As a side  
200 note: dialog boxes are common when you are interactively using Stata, so get use to them appearing as  
201 you point-and-click on different menus and cons. Within the dialog box, you can click “Browse...”  
202 button near the top right to find the unzipped .sav file on your computer.

203  
204

Figure 2-5: Screenshot of the "import spss" Dialogue Box

205 After you find the file, the location of the file will appear in the “Filename:” field at the top, along with  
206 the “Names in file:” field now populated with the variables in the dataset. You are welcome to scroll  
207 through the “Names in file:” field to get a sense of the variables and their labels. After that, you can click  
208 the “OK” button in the bottom right of the dialog box, and now you have successfully imported your  
209 data into Stata!

210

## 211 Review the Data in Stata

212 For a seasoned data analyst, what we went through above is unremarkable. But do not pay any attention  
213 to these haters who have forgotten where they started. Remember your beginnings, and never forget  
214 them, because it keeps us humble as to where we have been, where we are, and where we want to go.

215

216 By clicking the “OK” button in the prior dialog box, you essentially typed the following text in the  
217 Command field at the Command window, located in the center bottom panel:

218

219 **import spss using "C:\Users\joshf\OneDrive\Cuyamaca College\Book IPSRM\PPIC 2020-**  
220 **january\2020.01.15.release.sav"**

221

222 Immediately after that command is executed, the following output appears below:

223 (73 vars, 1,707 obs)

224

225 Let us re-examine the Stata user interface. The interface includes seven elements:

226 1. Top left menu: no change

227 2. Top left buttons: no change

228 3. Left panel labeled “History now includes two lines: #1 update query and #2 import spss...

229 a. It is clear to us now that the “History” panel list the history of commands we typed or  
230 executed by pointing and clicking.

231 4. The Results window, located in the center top panel, which contains output of commands. In  
232 addition to **update query**, we now see **import spss using**

233 **"C:\Users\joshf\OneDrive\Cuyamaca College\Book IPSRM\PPIC 2020-**  
234 **january\2020.01.15.release.sav"**

235 5. Center bottom panel labeled “Command”: no change.

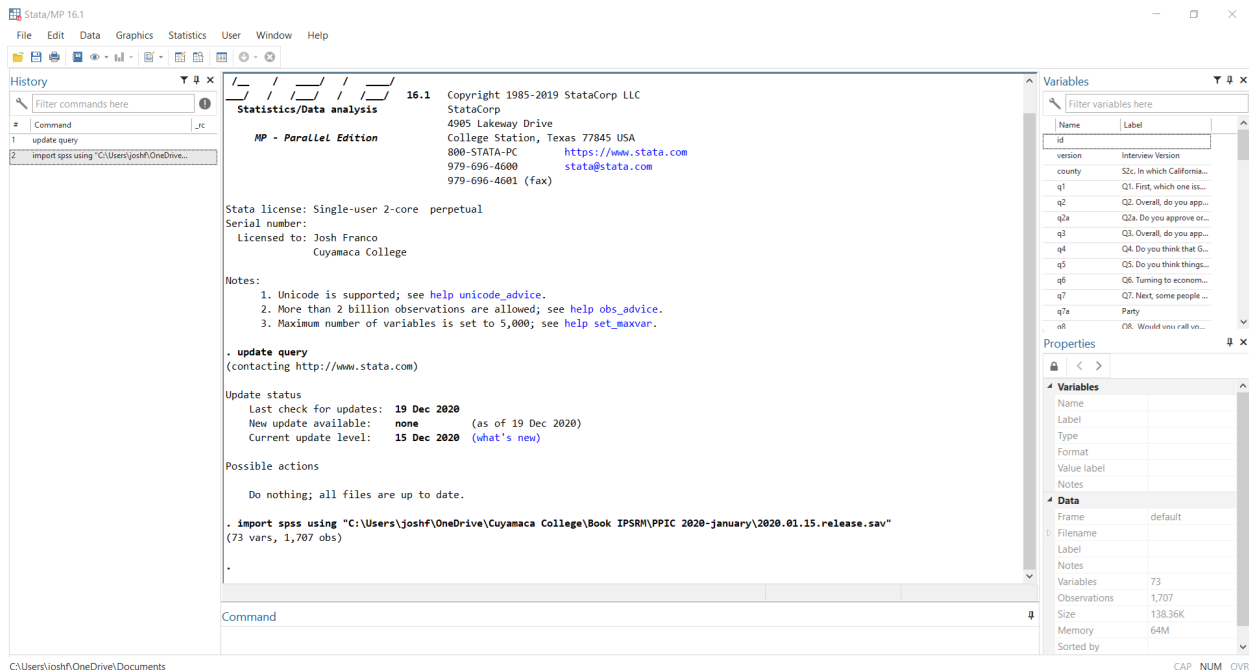

236 6. Right top panel labeled “Variables” now includes a list of variable Names and their Labels.

237 a. Whenever you import a dataset, you’ll see the variables listed in the Variables window

238 7. Right bottom panel labeled “Properties” now has information in the “Data” portion.

239 a. We see the Variables field change from blank to 73; Observations change from blank to  
240 1,707; Size change from blank to 138.36k; and Memory change from blank to 64M.

241

242  
243

Figure 2-6: Revisiting of the User interface of Stata after importing data.

244

## 245 Describe the Data

246 In the Command field, we type **describe** and the following appears:

247 Contains data

248 Obs: 1,707

249 Vars: 73

250

251 Obs stands for observations. In this case, there are 1,707 observations. And Vars stands for variables.

252 There are 73 variables in this data.

253

254 After this output, we see a table with five columns: variable name, storage type, display format, value label, and variable label. The two columns we are most interested is variable name and variable label. The variable name identifies the column of observations; for example, the variable county records the county in which the respondent lives. Whenever you want to refer to that column of data, you'll use the variable name, regardless if you're typing in the Command window, using a dialog box, or making a selection in the Variables window. The variable label is attached to the variable, and it describes the contents of the variable.

261

262 For example, the variable **county** has the variable label **S2c. In which California county do you live?** Or the variable **q8** has the variable label **Q8. Would you call yourself a strong Democrat or not a very strong Democrat?**

# Chapter 3 - Datasets: Cross-section, Time Series, and Panel

## About

Data are typically stored in a tabular manner, with rows and columns. One of the most common datasets are spreadsheets that contain rows and columns. The intersection of rows and columns creates cells. Numeric, alpha, and alphanumeric data can reside in these cells.

The image below is a screenshot of a Microsoft Excel spreadsheet, a very common software. There are four rows marked: 1, 2, 3, and 4; and there are four columns marked: A, B, C, and D. These 4 rows and 4 columns create 16 cells. Cells A1, B1, and C1 are populated with the following data: “123” (numeric), “abc” (alpha), and “123abc” (alphanumeric), respectively. Note that the remaining 13 cells are empty.

The screenshot shows the Microsoft Excel interface. The ribbon is set to 'Home'. The spreadsheet has 4 columns labeled A, B, C, and D, and 4 rows labeled 1, 2, 3, and 4. The data in row 1 is as follows:

	A	B	C	D
1	123	abc	123abc	
2				
3				
4				

Figure 3-1: Screenshot of Excel spreadsheet with 4 rows and 4 columns

## Estimated Time

An estimated 90-120 minutes is needed to complete this activity.

## Cross-Sectional dataset

Cross-sectional data contain information on many subjects, or units, for a single time period.

Observations can be persons, cities, states, countries, legislation, committees, schools, and so on.

Variables are concepts that are being measure, or observed, and they have at least two values. For example, the variable `age` can have values from 0 to 100+. Or the variable `race` can have the values African American, White, Hispanic, Asian American, and so on.

For an example of a cross-sectional dataset, I updated the Microsoft Excel spreadsheet from above. In cells A1 through E1 included the variable name. It is common to use the 1<sup>st</sup> row of cells to state the variable name of each column. In rows 2 through 5, I have four notable people listed: Cardi B, Joe Biden, Dolores Huerta, and Andrew Yang. For each person, I have information about their `gender`, `age`, `race`, and `year` the data was collected.

The data is cross-sectional because we are looking at many objects (notable persons) in a single time period (year 2020).

	A	B	C	D	E
1	<b>name</b>	<b>gender</b>	<b>age</b>	<b>race</b>	<b>year</b>
2	Cardi B	Female	28	African American	2020
3	Joe Biden	Male	78	White	2020
4	Dolores Huerta	Female	90	Hispanic	2020
5	Andrew Yang	Male	45	Asian American	2020

Figure 3-2: Example of a cross-sectional dataset

## Time Series dataset

With time-series data, we are looking at a single subject, or object, over multiple time periods.

Below we have some time-series data on Cardi B, one of the notable individuals from the cross-sectional datasets. In cells A1 through F1, we see six variables: `name`, `gender`, `age`, `race`, `year`, and `singlerecords`. The variable `singlerecords` refers to the number of single songs with Cardi B as lead artist ([Cardi B discography - Wikipedia](#)).

325 The data is time series because we are looking at one object (Cardi B) over multiple time periods (years  
326 2017 to 2020). And in this case, our variables `age`, `year`, and `singlerecords` change for each row of  
327 data.

328

	A	B	C	D	E	F
1	<b>name</b>	<b>gender</b>	<b>age</b>	<b>race</b>	<b>year</b>	<b>singlerecords</b>
2	Cardi B	Female	25	African American	2017	3
3	Cardi B	Female	26	African American	2018	4
4	Cardi B	Female	27	African American	2019	3
5	Cardi B	Female	28	African American	2020	1

329  
330

Figure 3-3: Example of a time series dataset

331

## 332 Panel dataset

333 Panel data contains information on multiple objects for multiple time periods.

334

335 For an example of a panel dataset, I updated the time series dataset to include a second musical artist:  
336 Harry Styles. Again, in cells A1 through F1, we see six variables: `name`, `gender`, `age`, `race`, `year`, and  
337 `singlerecords`.

338

339 The data is panel because we are looking at multiple objects (Cardi B and Harry Styles) over multiple  
340 time periods (years 2017 to 2020). And again, our variables `age`, `year`, and `singlerecords` change for  
341 each row of data for each artist. For example, for year 2017, both Cardi B and Harry Styles ([Harry Styles](#)  
342 [discography - Wikipedia](#)) had 3 single records. But in year 2019, Cardi B had 3 compared to Harry's 2  
343 singles.

	A	B	C	D	E	F
1	<b>name</b>	<b>gender</b>	<b>age</b>	<b>race</b>	<b>year</b>	<b>singlerecords</b>
2	Cardi B	Female	25	African American	2017	3
3	Cardi B	Female	26	African American	2018	4
4	Cardi B	Female	27	African American	2019	3
5	Cardi B	Female	28	African American	2020	1
6	Harry Styles	Male	23	White	2017	3
7	Harry Styles	Male	24	White	2018	0
8	Harry Styles	Male	25	White	2019	2
9	Harry Styles	Male	26	White	2020	3

Figure 3-4: Example of a panel dataset

344  
345

346

## Mini-Assignment #1: Instructions

347

### Step 1: Select 1 dataset type that interests you.

348

Your dataset choices are:

349

- Cross-sectional
- Time series
- Panel

350

351

352

353

### Step 2: In 4 or more sentences, explain why you selected this dataset type.

354

- To help write your explanation, consider the following questions:
  - What is one strength of the dataset you selected?
  - What is one weakness of the dataset your selected?
  - How does your dataset compare to one of the other datasets?

355

356

357

358

361

# Chapter 4 - Data Management

362

363

## About

365 Data management is the structure and process by which you organize and manage your data and  
366 datasets. Often overlooked, data management is a key process to be aware of and implement for projects,  
367 small and large. There are at least seven features to be aware of related to data management: storing,  
368 sourcing, folders, files, version control, base dataset, and variable data.

369

## Estimated Time

371 An estimated 90-120 minutes is needed to complete this activity.

372

## Big Picture

374 Data management sounds complicated because it consists of several part. However, it is useful to see the  
375 forest for the trees. In other words, the forest seems vast and mighty, but when you look at individual  
376 trees, you can begin to appreciate the simplicity and complexity of both the forest and the trees.

377

378 The basic radial diagram helps us visualize the big picture. At the center is Data Management and  
379 radiating out from this are the seven features mentioned above: storing, sourcing, folders, files, version  
380 control, base dataset, and variable data. Keep this visualization in mind as we proceed in learning about  
381 each feature.

Figure 4-1: Seven features of data management

382  
383

## Storing Data

384

385 Storing data is about where you are going to save the data you will be working with. You can store data  
 386 in three places: 1) on your personal computer, 2) on an external thumb drive or hard drive, or 3) in the  
 387 “cloud” via the Internet.

388

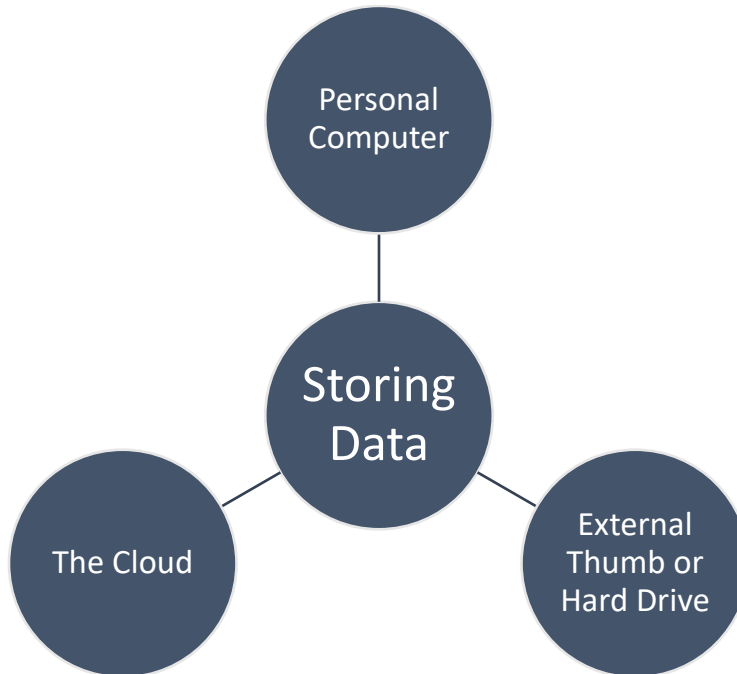

Figure 4-2: Three options for storing data.

389  
390

391  
392 Your personal computer is the logical place to store your data because it is your computer, and you use it  
393 regularly. One drawback to storing the data only on your computer is that if the computer fails, then all  
394 your data are likely lost, or very costly to retrieve.

395  
396 The second place to store your data is on an external thumb drive or hard drive. Thumb drives are  
397 common these days, and not expensive, but you can lose since they are small devices. External hard  
398 drives are also available, but a bit costly.

399  
400 The third place, which I am going to recommend storing your data, is in the cloud. The growth of cloud  
401 computing, such as Google Drive or DropBox, over the last 10 years is changing the nature of how we  
402 interact with our computers and data.

403  
404 A drawback of the cloud is that you need an internet connection to retrieve the data. Thus, if your  
405 internet is spotty or you have lost power, then you will not be able to access your data. However, the  
406 advantage the cloud has to the other storage forms is that there is a backup of your data.

407

## 408 Sourcing Data

409 Sourcing data is about the source of where you find the data you want to analyze. There is a growing  
410 mountain of data sources. Recall from Chapter 2, I mentioned three specific data sources:

- 411 • [Inter-university Consortium for Political and Social Research \(ICPSR\)](#)
- 412 • [The Dataverse Project](#)
- 413 • [PPIC Statewide Survey Data - 2020 - Public Policy Institute of California](#)

414

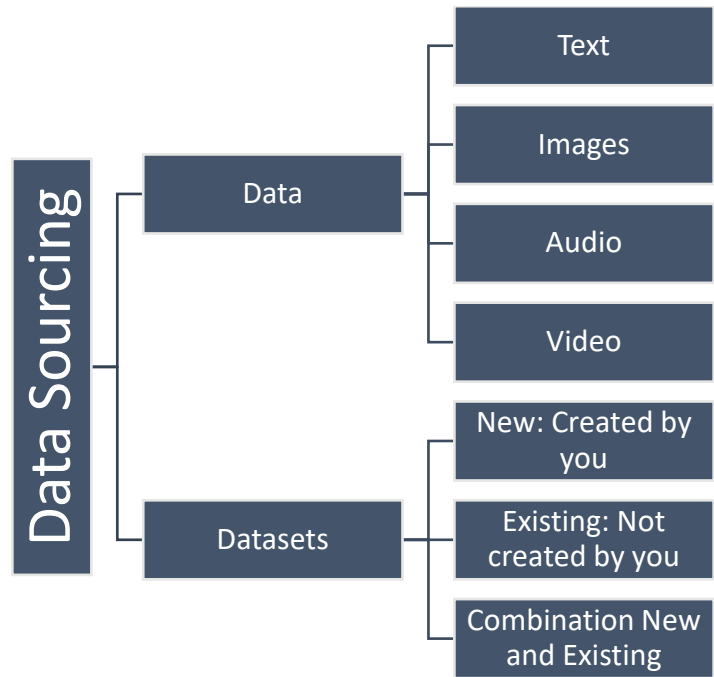

415 And there are other data sources as well. For example, consider the following:

- 416 • [Data.gov](#)
- 417 • [U.S. Census Data](#)
- 418 • [California Open Data](#)
- 419 • [GSS General Social Survey | NORC](#)
- 420 • [ANES | American National Election Studies](#)
- 421 • [Cooperative Congressional Election Study](#)
- 422 • [San Diego County Data Portal](#)

423

424 Up until this point, I have used data and datasets interchangeably. But, after introducing you to sourcing  
425 data, it is important to make a distinction between these terms. Data is a general term used to describe  
426 text (alpha, numeric, alphanumeric), images, audio, and video. All these can be considered data.

427 However, a dataset is a meaningful collection of data organized by an individual or team. Datasets can be  
428 created by you, not created by you, or a combination of the two.  
429

430  
431 *Figure 4-3: Making a distinction between data and datasets.*

432

### 433 **Non-academic example of using an existing dataset.**

434 For example, I attended UC Merced during 2005-2007 and again from 2012-2018. During this time, I  
435 met a fellow Bobcat named Michael Urner. Michael co-founded Tergis Technologies, “a company  
436 developing new medical devices to reduce the number of hospital-acquired infections.”<sup>1</sup> During a UC  
437 Merced Venture Lab presentation, Michael shared how he used [Centers for Disease Control and  
438 Prevention’s National Vital Statistics System](#) datasets to quantify the demand for his medical device. I  
439 thought this was a novel way of how a business entrepreneur can use an existing dataset.

### 441 **Academic example of creating a new dataset and using an existing dataset.**

442 Another example, this time from my Ph.D. dissertation titled [Judicial Pork: The Congressional Allocation  
443 of Districts, Seats, Meeting Places, and Courthouses to the U.S. District Courts](#). And I collected data from  
444 the [Federal Judicial Center | \(fjc.gov\)](#) to create a new dataset of federal court districts, seats, meeting  
445 places, and courthouses. I combined this dataset with existing datasets, such as [Charles Stewart's  
446 congressional committee data](#), to form a “super dataset” that I then analyzed for my research.

---

<sup>1</sup> [Alum Wins Opportunity to Pitch at Venture Summit | Newsroom \(ucmerced.edu\)](#)

## 448 Folders

449 Folders are the folders on your cloud drive that you place other folders and files into. You can think of  
450 folders like containers where you store files, like Word docs, pictures, and datasets.

00 STATA Workbook

451  
452

*Figure 4-4: Extra-large icon of my Google Drive "00 Stata Workbook" Folder*

453

## 454 Files

455 Files are the files that you store in folders located on your cloud drive. Below is a list of files that are likely  
456 to work with when conducting data analysis:

- 457 1. Text files (.txt)
- 458 2. Comma separated files (.csv)
- 459 3. Word Documents (.doc or .docx)
- 460 4. Pictures (.gif, .jpg, .png)
- 461 5. Audio (.mp3)
- 462 6. Videos (.mp4, .mov)
- 463 7. Excel spreadsheets (.xls or .xlsx)
- 464 8. Stata project files (.stpr)
- 465 9. Stata Do-files (.do)
- 466 10. Stata datasets (.dta)
- 467 11. PowerPoints (.pptx)

468

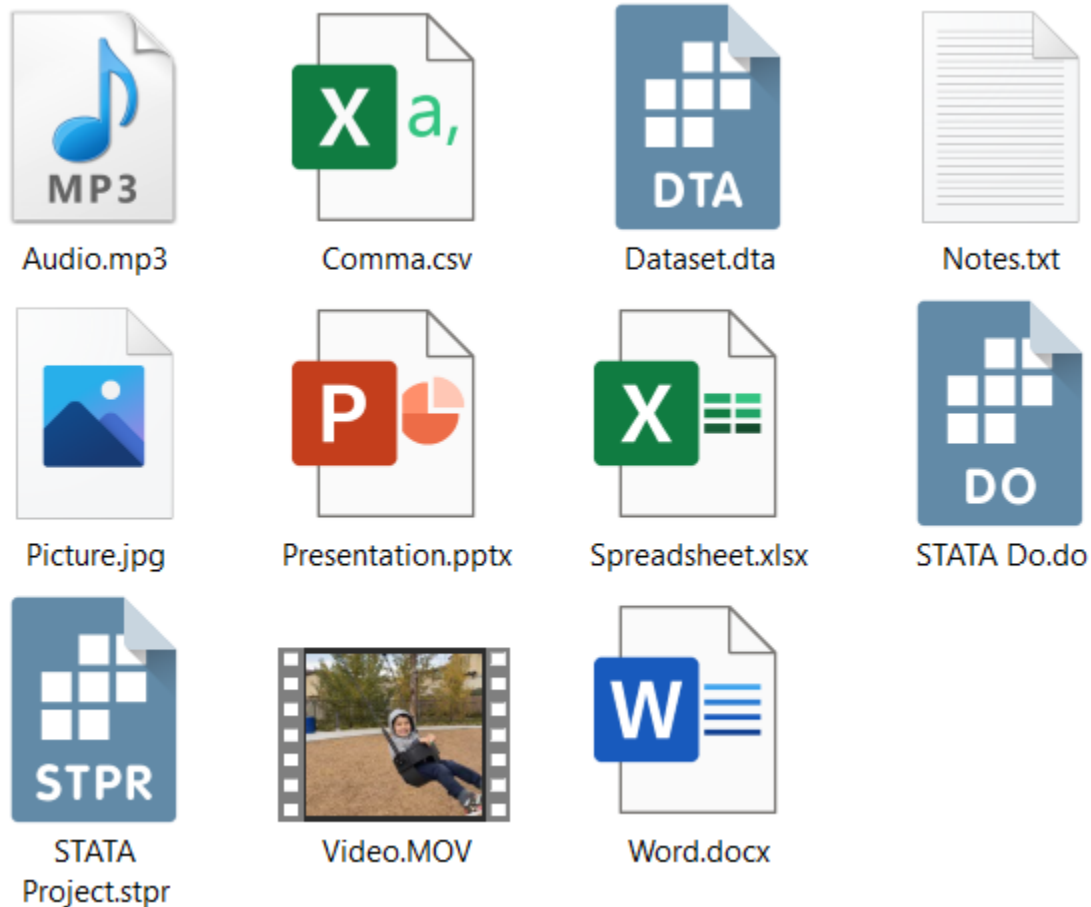

Figure 4-5: Large icons of different file types you are likely to use for data analysis.

469  
470

471

## 472 Version Control

473 According to [Wikipedia](#), “In software engineering, version control (also known as revision control,  
474 source control, or source code management) is a class of systems responsible for managing changes to  
475 computer programs, documents, large web sites, or other collections of information. Version control is a  
476 component of software configuration management.[1]”

477

478 Version control is important for data management because we need a systematic way of managing the  
479 folders and files that we are working with. Any data analysis project, simple or complex, requires  
480 organization and processes that are thought out and through in advance.

481

482 Students can use the `-version-` command in Stata to make sure that their programs will continue to work  
483 with future releases of Stata.

484

## 485 **Folder Structure**

486 Luckily for us, Stata has a [Project Manager](#) that helps us organize our folders and files. Below is sample  
487 outline of folders and files that you can use for a data analysis project:

- 488 • Project Folder
  - 489 ○ .stpr (Stata Project Manager file)
  - 490 ○ 00 Log folder

516  
517

Figure 4-6: Visual representation of Project folder structure

518 As you read through the list and view the visual representation of a project’s folder structure, you may be  
519 asking “Why number folders starting with 00, 01, 02, and so on?” The reason is that computers sort  
520 folder and files alphabetically. However, I need folders sorted according to data management principles  
521 and data analysis processes. The nine folders included in this example follow a linear process for  
522 completing data analysis projects:

- 523 • keep a log of what you are doing.
- 524 • do what you need to do.
- 525 • catalog your data sources.
- 526 • define and organize your variables.
- 527 • organize and use your datasets.
- 528 • apply models to analyze datasets.
- 529 • store graphs and charts created from your models.
- 530 • store tables resulting from your models.
- 531 • write papers based on your findings.
- 532 • present your findings to others.

533

## 534 File Naming

535 File naming is another way of maintaining version control. I use the two-number prefix (aka 00 File  
536 name, 01 File name, etc.) for do files, variable files, and dataset files. For example, here is a list of eight  
537 different file naming conventions:

538

- 539 • 00 Master.do: runs all the other .do files.
- 540 • 01 Base dataset.do: prepares the theoretically possible base dataset (more on this in the next
- 541 section)
- 542 • 02 Data source 01.do: converts a 1<sup>st</sup> data source from .xlsx to .dta
- 543 • 03 Variables.do: brings in variables and variable labels into the base dataset.
- 544 • 04 Dataset 01.do: combines or merges converted datasets into the Base dataset.
- 545 • 05 Dataset Analysis Ready.do: ensures the combined dataset is ready for analysis.
- 546 • 06 Descriptive.do: produces descriptive statistics and cross-tabulations on the Analysis Ready
- 547 dataset
- 548 • 07 Models.do: runs theoretically informed statistical and data analysis models on the Analysis
- 549 Ready dataset

550

551 Files with a two-number suffix could have additional similarly named files. For example, “02 Data  
 552 source 01.do” is referring to a single data source. However, what if you are relying on two or more data  
 553 sources? In this case, you can create a second file named “02 Data source 02.do” and so forth.

554

555 While no data analysis project is completed in a linear fashion, it can be organized in a linear fashion so  
 556 that you can replicate the process for yourself, and others can examine your work, if needed or required.

557

## 558 Base Dataset

559 A base dataset is the theoretically possible dataset given your research question, theory, and research  
 560 design. For example, what if I wanted to analyze the unemployment rate of all 50 U.S. states over the last  
 561 10 years by month. What type of dataset do I need? And how many observations (rows of data) could I  
 562 possibly have?

563

564 The answer is a panel dataset that contains 6,600 observations (50 U.S states times 11 years times 12  
 565 months). You may be asking: “Why 11 years instead of 10 years, didn’t you say over 10 years?” Yes, but  
 566 if you count 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, and 2020, that is eleven unique  
 567 years.

568

569 How can we create this base dataset in Stata? The answer may be to point-click-drag in Microsoft Excel  
 570 or Google Sheets, or you can use Stata and the following code:

```
571 clear
572 set obs 6600
573 egen float month = seq(), from(1) to(12) block(1)
574 egen float year = seq(), from(2010) to(2020) block(600)
575 egen float state = seq(), from(1) to(50) block(12)
576 gen statename = .
577 gen unemployment = .
```

578

579 These commands generate the following empty dataset of 6,600 observations of state-year-months:

Data Editor (Browse) - [Untitled]

File Edit View Data Tools

month[1] 1

	month	year	state	statename	unemployrate
1	1	2010	1	.	.
2	2	2010	1	.	.
3	3	2010	1	.	.
4	4	2010	1	.	.
5	5	2010	1	.	.
6	6	2010	1	.	.
7	7	2010	1	.	.
8	8	2010	1	.	.
9	9	2010	1	.	.

6597	9	2020	50	.	.
6598	10	2020	50	.	.
6599	11	2020	50	.	.
6600	12	2020	50	.	.

580  
581

Figure 4-7: Base dataset of 6600 observations of state-year-months

582  
583

584 Taking the “Base dataset” approach helps you think of the data magnitude of the research question you  
585 are trying to answer. I do not think one should shy from large datasets, since that is partly the strength of

586 data analysis today, but this approach allows you to be honest with yourself about the work that lies  
587 ahead.  
588

## 589 **Variable Data**

590 Variable data are the columns of data that you want to have in your Analysis Ready dataset. However,  
591 going from idea to reality will take work, especially if you are creating a dataset from scratch. Let me  
592 demonstrate with an existing dataset compared to a new dataset.  
593

### 594 **Existing Dataset**

595 Existing datasets may simply be a spreadsheet to you, but to the person or team who created it and  
596 populated the cells with data, it is proud achievement. While computers have eased this process in some  
597 ways, it can be as tedious as a cell-by-cell hand entry. Therefore, you should not sneeze at any dataset,  
598 because the amount of time and effort could be in the hundreds or thousands of hours.  
599

600 Existing datasets already have variable data in them. Let us return to the Public Policy Institute of  
601 California (PPIC)'s data that I shared in Chapter 2. I visited [PPIC Statewide Survey Data - 2020 - Public](#)  
602 [Policy Institute of California](#), downloaded the [January 2020 Survey Data](#), unzipped the folder, and  
603 uploaded the .sav file onto the *Introduction to Political Science Research Methods* website. Now, I open  
604 Stata software and type the following command:

```
605  
606 import spss using "https://www.ipsrm.com/stata/2020.01.15.release.sav"  
607
```

608 After a few moments, 1,707 observations (rows of data) and 73 variables (columns of data) are loaded  
609 into Stata and essentially ready for analysis.  
610

### 611 **Creating a New Dataset**

612 Creating new datasets is a lot of work. It takes time, planning, and perseverance. I will share a short story  
613 about my dissertation [Judicial Pork: The Congressional Allocation of Districts, Seats, Meeting Places, and](#)  
614 [Courthouses to the U.S. District Courts](#).

615  
616 Below are the lines of code from the section "Generate Datasets" in my Master.do file for my  
617 dissertation. Lines that begin with the asterisk (\*) symbol are not processed by Stata, so they serve as an  
618 informative note.  
619

620 See that I created the base dataset on Sunday, March 12, 2017. Through that month, I was importing  
621 variables left and right, then matters slowed down.  
622

623 Another batch of variables were imported in June 2017, and then again February 2018, with the final  
624 variable imported on Sunday, April 15, 2018, a full year later.

625

```
626 *           3) Generate Datasets

689 run ".\Do\CtrJ_TimeSinceLast_DpV_JCt.do" // Created 54, Completed: Sunday, February 18, 2018
690 run ".\Do\CtrJ_JudConf_JSt.do" // Created 55, Completed: Sunday, April 15, 2018
691
```

```
692 *modern area post-1945
693 * new state emergence, population growth, workload changes, courts (Judicial Conference)
694
695 run ".\Do\AR_01.do" // Completed: Thursday, May 11, 2017
696
```

697 You will also notice that there are many asterisks, which means I skipped collecting and eventually  
698 importing that data. At some point, what you have planned for your research does not pan out, so you  
699 need to choose how you are going to spend your limited time.

700

701 I want to draw your attention to the following lines of code, because I had to personally collect the data  
702 related to these variables.

```
703 run ".\Do\DpV_JDt.do" // Created 02, Completed: Sunday, March 12, 2017
704 run ".\Do\DpV_JSt.do" // Created 03, Completed: Monday March 13, 2017
705 run ".\Do\DpV_JMP.do" // Created 04, Completed: Saturday, March 18, 2017
706 run ".\Do\DpV_JCt.do" // Created 05, Completed: Saturday, March 18, 2017, Update: 3/8/18 added
707 GAO list
708
```

709 My research question was: How does Congress structure the Judiciary, specifically the organization of  
710 the lower District Courts? To answer this question, I needed variable data for judicial districts, judicial  
711 seats, judicial meeting places, and judicial courthouses.

712

713 Let me show you what just one of these .do files included. Below are the lines of code for the  
714 “DpV\_JCt.do” file, which stands for Dependent Variable – Judicial Courthouses.

715

```
716 * DO File for DpV_JCt
717 * History:
718 * Created: Saturday, March 18, 2017
719 * Data Collection Process and Data Coding Instructions
720 * I collected data on Judicial Courthouses from the Federal Judiciary Center (FJC)'s website.
721 * First, I went to http://www.fjc.gov/history/courthouses.nsf.
722 * Second, I selected a state from the drop-down menu on the left hand navigation bar.
723 * Third, I reviewed the list of courthouse locations
724 * Forth, I clicked on the link of the courthouse location and collected the following
725 information: city and state of courthouse, year completed, supervising architect, year extension
726 completed, and status of courthouse.
727 * I then inputted this data into a Microsoft Excel spreadsheet and subsequently imported into
728 Stata.
729
730 clear
731 import excel "C:\Users\joshf\OneDrive\Dissertation\Data\Judicial Courthouses\USDC Courthouses
732 01.xlsx", sheet("for Stata") firstrow
733 duplicates tag, generate(dup)
734 duplicates list
735 duplicates list id_icpsr_statenamelower year
736 duplicates drop id_icpsr_statenamelower year, force
737 drop dup
738 drop if year<1789 // 2 Observations deleted
739 save ".\DTAs\DpV_JCt.dta", replace
740
741 clear
742 use ".\DTAs\04.dta"
743 drop DpV_JCt
744 merge 1:1 id_icpsr_statenamelower year using
745 "C:\Users\joshf\OneDrive\Dissertation\Data\Stata\DTAs\DpV_JCt.dta"
746 label variable DpV_JCt "Judicial Courthouses"
747
748 * Note: I do not have a DpV_JCt_Tot variable: January 18, 2018
749 drop _merge
750 save ".\DTAs\05.dta", replace
```

751 \* Completed: Saturday, March 18, 2017  
752

753  
754 Now, the Microsoft Excel spreadsheet (“USDC Courthouses 01.xlsx”) I imported was originally created  
755 on March 2, 2017 and then over the next two weeks, I collected the data from the Federal Judiciary  
756 Center website and prepared the data so it could be imported into Stata on March 18, 2017.  
757

## 758 Mini-Assignment #1: Instructions

759 **Step 1: Declare a research question.**

760

761 **Step 2: Declare an independent variable (aka explanatory variable aka cause)**  
762 **that is derived from your research question.**

763

764 **Step 3: Declare a dependent variable (aka outcome variable aka effect) that is**  
765 **derived from your research question.**

766

767 **Step 4: Declare at least 3 search terms.**

768 List search terms you would type in a Google search to try to find a dataset related to your research  
769 question.

770

## 771 Mini-Assignment #1: Rubric

Criteria	Ratings	Points
Research question declared	Yes	25
	Missing	0
Independent variable declared	Yes	25
	Missing	0
Dependent variable declared	Yes	25
	Missing	0
Google search terms: #	3	75
	2	50
	1	25
	Missing	0

772

# Chapter 5 - Descriptive Statistics

## About

Descriptive statistics include the number of observations, the number of variables, the mean, median, and mode of each variable, and charts and graphs that help to visualize these statistics.

Descriptive statistics are under the umbrella of exploratory analysis. Exploratory analysis is exploring and examining the data, partly to feed your curiosity, but also to search for outliers and other unexpected features of the data.

## Estimated Time

An estimated 90-120 minutes is needed to complete this activity.

## How do I produce descriptive statistics in Stata?

Producing descriptive statistics consists of a 4-part process: import, describe, summarize, and tabulate. Below is a basic bending diagram to visualize the production of descriptive statistics in Stata.

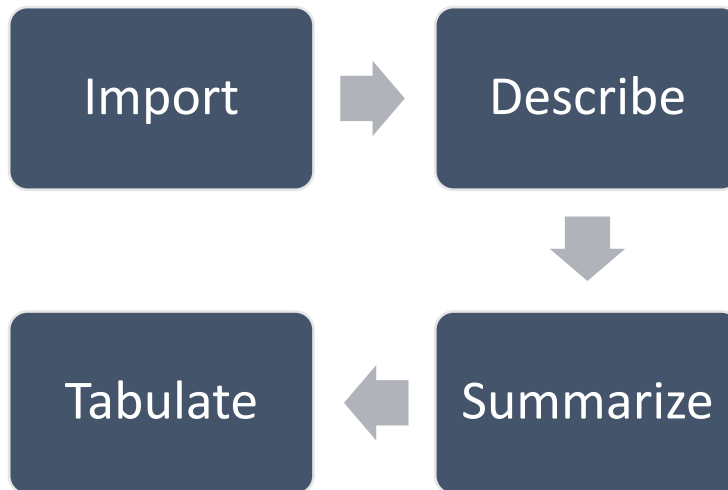

Figure 5-1: Basic bending process diagram to visualize the production of descriptive statistics.

### Part 1: Import dataset into Stata

Let us use the Public Policy Institute of California's (PPIC)'s [Statewide Survey Data](#) for [January 2020 Survey Data](#) that I introduced in prior chapters.

Open Stata. Once in Stata, type in the following command:

796 `import spss using "https://www.ipsrm.com/stata/2020.01.15.release.sav"`

797

798 After this command is executed, you will see the following output:

799 (73 vars, 1,707 obs)

800

801 This output means there are 73 variables (columns) and 1,707 observations (rows) of data in the dataset.

802

## 803 **Part 2: Describe the dataset**

804 Next, let us type the following command:

805 `describe`

806

807 After this command is executed, you will begin to see the following output. I truncated the output in the  
808 image below because it goes on for about 75 more lines.

809

```
. describe
```

```
Contains data
```

```
  obs:    1,707  
  vars:     73
```

810

811 *Figure 5-2: Output from the "describe" command in Stata.*

812 The describe command produces a table with five columns: variable name, storage type, display format,

813 value label, and variable label.

814

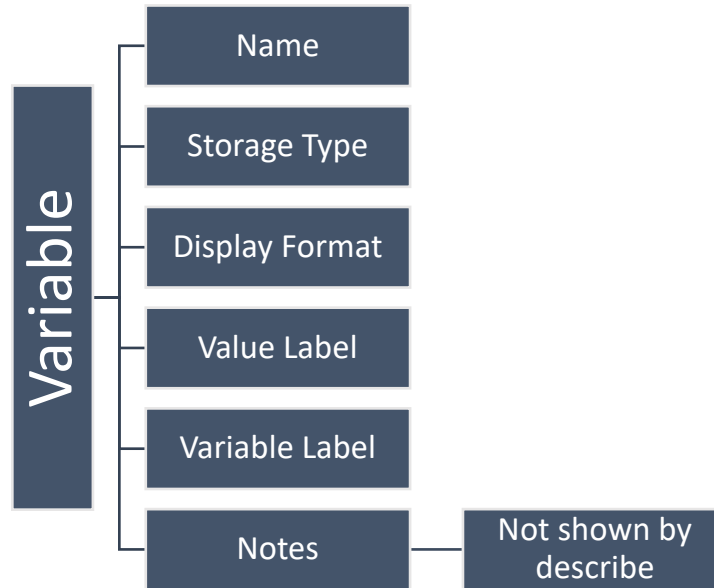

Figure 5-3: Variable properties

815  
816

817

818 Variable name is the name of the variable, and it is the term you use when inputting variables in the  
819 Command field at the Center Bottom Panel or typing the variable name in .do file.

820

821 Storage type indicates how the variable is stored in the dataset. Types include byte, int, long, float,  
822 double, and str. The first five types store numeric only variables, while str stores alpha or alphanumeric.

823

824 The display format specifies how values are displayed. For example, for numeric variables, you can  
825 specify whether to include a leading minus sign and how many digits you want displayed after the  
826 decimal.

827

828 Value label is how the values of the variable are presented. For example, Question 5 asks: *Do you think*  
829 *things in California are generally going in the right direction or the wrong direction?* And there are four  
830 answer choices: 1 = right direction; 2 = wrong direction; 3 = (vol) don't know; and 4 = (vol) refuse.

831

832 In the Data Editor of Stata, you see the following:

Data Editor (Browse) - [Untitled]

File Edit View Data Tools

Figure 5-4: View of Data Editor in Stata

833  
834

835

836 Notice that for *q5* (the last column in the figure above), we see that the survey respondent in row 1, with  
837 identification number 546.00, respond “wrong direction” when answering Question 5. We see “wrong  
838 direction” instead of the number “2” because of the value label applied to variable *q5*.

839

840 Lastly, variable label, which is not the same as value label, should be an informative, but short,  
841 description of the variable. For *q5*, the variable label is: *Q5. Do you think things in the California are*  
842 *generally going in the right direc.*

843

### 844 Part 3: Summarize all variables

845 Type the following command:

846 **summarize**

847

848 After this command is executed, you will begin to see the following output. Again, I truncated the output  
849 in the image below because it goes on for about 50 more lines.

850

```
. summarize
```

Variable	Obs	Mean	Std. Dev.	Min	Max
id	1,707	2.15e+07	1.85e+07	546	5.00e+07
version	1,707	1.738137	.4397773	1	2
county	1,707	27.56942	13.48306	1	58
q1	1,698	26.15665	28.85894	1	98
q2	1,683	2.341652	2.331166	1	8
q2a	1,685	3.354896	2.988077	1	8
q3	1,683	2.278669	2.193698	1	8
q4	1,693	2.076787	2.111829	1	8
q5	1,695	1.739233	1.343299	1	8
q6	1,694	2.014168	1.912384	1	8
q7	1,706	1.271981	.8884402	1	8

Figure 5-5: Output from the "summarize" command in Stata.

851  
852

853 The **summarize** command produces a table with 6 columns, the rows equivalent to the number of  
854 variables in the datasets. The 6 columns are: variable name, observations, mean, standard deviation,  
855 minimum, and maximum values.

856

857 Variable name and number of observations are straightforward. However, for a budding data analyst, the  
858 other four columns could use some explanation.

859

860 Let us inspect variable q3. According to the PPIC's [Survey Codebook](#), q3 stands for Question 3 of the  
861 survey. This question asks respondents (aka people taking the survey) the following question: *Overall, do*  
862 *you approve or disapprove of the way that the California Legislature is handling its job?*

863

864 There are four possible answer choices: approve, disapprove, and don't know. These alpha choices are  
865 coded numerically so they can be processed by statistical analysis software, like Stata. Therefore, approve  
866 = 1, disapprove = 2, and don't know = 8. The reason you see "approve" instead of the "1" in the  
867 spreadsheet is because of a value label that has been applied to Question 3 variable.

868

869 Mean is the average value of the variable across all observations. For q3, the mean is 2.278669. If the  
870 mean was 1, that means all 1,683 respondents approved of the California Legislature. And if the mean  
871 was 2, that means all 1,683 respondents disapproved of the California Legislature. And if the mean was 8,  
872 that means all 1,683 respondents don't know of the California Legislature handling its job. And so, you  
873 can conclude what the mean would be if all respondents refused to answer Question 3. Unfortunately,

874 with the numeric coding of don't know and refuse as 8 and 9, respectively, these high numbers can skew  
875 the mean in one direction or another.

876

877 According to [Standard deviation - Wikipedia](#), "In statistics, the standard deviation is a measure of the  
878 amount of variation or dispersion of a set of values. A low standard deviation indicates that the values  
879 tend to be close to the mean (also called the expected value) of the set, while a high standard deviation  
880 indicates that the values are spread out over a wider range."

881

882 For q3, the standard deviation is 2.19. Relying on the [68–95–99.7 rule](#), this standard deviation suggests  
883 that 68% of observations have q3 values ranging between 0.08 and 4.46. However, with the numeric  
884 coding of "don't know" as 8, these high numbers can skew the standard deviation as well.

885

886 Minimum and maximum refer to the minimum value of the variable and the maximum value of the  
887 variable, respectively. Thus, for q3, the lowest numeric value is 1 (aka approve) and the highest numeric  
888 value is 8 (aka don't know).

889

890 At this point, you may be telling yourself: "The **summarize** command tells me nothing!" That is a strong  
891 statement, but I understand the sentiment you are expressing. However, the output of the `summarize`  
892 command is informative because it is suggesting that you need to try another command to get more  
893 useful output.

894

## 895 **Part 4: Tabulate variables one-by-one**

896 Given that we are disappointed with the output from the **summarize** command, we need to use another  
897 command to help us explore our data. There is where **tab1** can help since it produces a one-way table of  
898 frequencies.

899

900 Type the following command:

901 **tab1 q3**

902

903 After this command is executed, you will begin to see the following output.

```
. tab1 q3
```

```
-> tabulation of q3
```

Q3. Overall, do you approve or disapprove of the way that the California Legisla	Freq.	Percent	Cum.
approve	773	45.93	45.93
disapprove	703	41.77	87.70
(VOL) don't know	207	12.30	100.00
Total	1,683	100.00	

904  
905

Figure 5-6: Output from the "tab1" command in Stata

906

907 Recall Question 3 of the survey. This question asks respondents (aka people taking the survey) the  
908 following question: *Overall, do you approve or disapprove of the way that the California Legislature is*  
909 *handling its job?*

910

911 **tab1** command produces a table with 4 columns: variable label, frequency, percent, and cumulative for  
912 q3 and its values. Column 1 restates the survey question, although it cuts it off after a certain number of  
913 characters, and the value labels of the responses provided. The three value labels are *approve*, *disapprove*,  
914 and *(VOL) don't know*. Interestingly, no one refused to answer this survey question, that is why we don't  
915 see a row for "*(VOL) refuse*". Side note: VOL means volunteered, since *don't know* and *refuse* are not  
916 formal answer choices and must be volunteered by the survey respondent with answering the question.

917

918 Column 2, labeled "Freq." stands for frequency, or the number of times that value appears in the dataset.  
919 In this case, we see that 773 respondents approve of the California Legislature, 703 disapprove, and 207  
920 don't know.

921

922 Column 3, labeled "Percent" means percentage, or the percent of respondents who answered a particular  
923 value. We see the 45.93% of respondents approve, 41.77% disapprove, and 12.30% don't know how the  
924 California Legislature is handling its job.

925

926 Finally, Column 4, labeled “Cum.” stands for cumulative, or the total cumulative percent of respondents  
927 who answered the survey question.

928

929 As you see, the **tab1** is more informative than the summarize command when it comes to this dataset  
930 and its variables.

931

## 932 **Mini-Assignment #1: Instructions**

933 **Step 1: Select two parts of the four-part descriptive statistics process.**

934

935 **Step 2: Explain in 2 or more sentences how the two parts are related to each**  
936 **other.**

937

938 **Step 3: Explain in 2 or more sentences what is unclear to you about one of the**  
939 **two parts you selected.**

# Chapter 6 - Model Selection

943

## About

944

945 This chapter on model selection initiates our exploration of statistical and data analysis models that  
946 professors, researchers, scientists, data analysts, and students use to empirically examine the relationship  
947 between at least two variables of interest: an explanatory (aka independent) variable and an outcome  
948 (aka dependent) variable.

949

## Estimated Time

950

951 An estimated 90-120 minutes is needed to complete this activity.

952

## The Research Process

953

954 The research process includes question, theory, hypothesis, research design, empirical analysis, and  
955 results. These concepts, and more, are covered in [Introduction to Political Science Research Methods –  
956 An Open Education Resource Textbook \(ipsrm.com\)](#), which this Workbook is a companion to.

957

958 As a friendly refresher, below is a complex radial diagram that shows the six main branches of the  
959 research process: question, theory, hypothesis, research design, empirical analysis, and result. Each  
960 branch has at least one informative stem.

961

Figure 6-1: Complex radial diagram of the research process

962  
963

964 As you will notice, Model Selection is a stem of the Empirical Analysis branch. And it should be clearly  
965 stated that empirical analysis does not appear out of thin air. It is a product of the question, theory,  
966 hypothesis, and research design.

967

## 968 What is Model Selection?

969 There is a plethora of models to select from: linear, binary, ordinal, categorical, count, fractional,  
970 generalized linear, choice, time series, panel, survival, endogenous covariates, structural equation  
971 modeling, and so on. The question inevitably is “Which model do I select?”

972

973 Model selection is your choice of statistical or data analysis model based on the nature of your  
974 dependent variable, and to some extent the nature of your independent variable(s), and the type of  
975 dataset (cross-sectional, time series, or panel).

976

## 977 **Nature of Dependent Variable**

978 Dependent variables can either be discrete or continuous. Discrete variables are typically non-negative  
979 integers, while continuous variables can range from negative infinity to positive infinity. If your  
980 dependent variable is continuous, saying amount lost or gained in the stock market during a 12-month  
981 period, you will likely select a linear model and use the **regress** command in Stata.

982

983 However, if your dependent variable is discrete, then we need to consider what type of discrete variable  
984 is it. There are at least four types of discrete variables: binary, ordinal, categorical, and count.

985

986 Binary variables have only two values (say 0 for off and 1 for on). In Stata, we would use the **logit** or  
987 **probit** command.

988

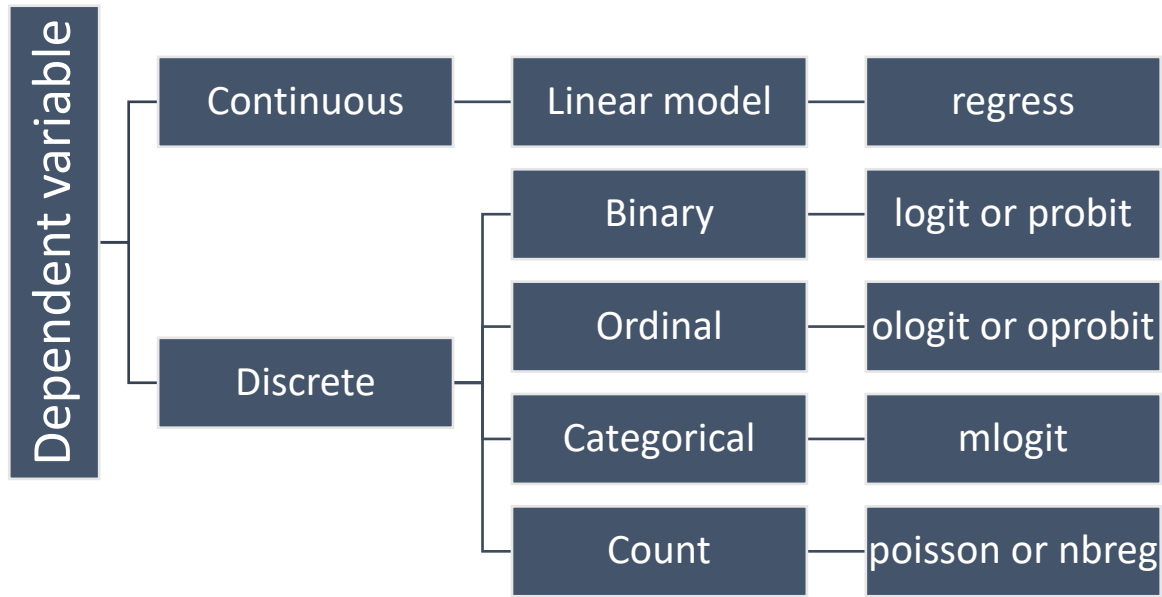

989 Ordinal variables have values that can be ordered from least to most (say 0 for indifferent, 1 for some  
990 feelings, and 2 for strong feelings). And Stata has **ologit** and **oprobit** commands, among other ordinal  
991 models.

992

993 Categorical variables have values that have no logical ordering (say 1 for walking, 2 for biking, 3 for  
994 swimming, and 4 for running); for fitting models with these types of dependent variables you can use  
995 **mlogit**, or another one of Stata's commands for categorical outcomes.

996

997 Finally, count variables have at least 3 values (say 1 child, 2 children, 3 children, and so on) and Stata has  
998 **poisson** and **nbreg** commands for fitting models with these types of dependent variables. Below is a  
999 horizontal multi-level hierarchy diagram visualizing dependent variable, its nature, models, and  
1000 corresponding Stata command(s).

1001  
1002 *Figure 6-2: Horizontal multi-level hierarchy diagram visualizing dependent variable, its nature, the model, and the Stata command.*

1003  
1004 **Type of Dataset**

1005 Recall from Chapter 3 on Datasets, there are three types: cross-sectional, time series, and panel. Along  
1006 with the nature of the dependent variable, the type of dataset will inform you model selection as well.

1007  
1008 *Table 6-1: Stata Command by Dataset Type and Dependent Variable Type*

	Linear	Binary	Ordinal	Categorical	Count
Cross-sectional	<b>regress</b>	<b>logit probit</b>	<b>ologit oprobit</b>	<b>mlogit</b>	<b>poisson nbreg</b>
Time series	*	*	*	*	*
Panel	<b>xtreg</b>	<b>xtlogit</b>	<b>xtologit</b>	<b>cmxtmixlogit</b>	<b>xtpoisson xtnbreg</b>

1009 \* I do not have the time series row populated since I have not yet meaningfully used time series models.

1010  
1011 **Mini-Assignment #1: Instructions**

1012 **Step 1: Select one of the 1 of the 10 model options.**

1013 The 10 options are:

- 1014 - **regress**
- 1015 - **logit/probit**
- 1016 - **ologit/oprobit**
- 1017 - **mlogit**
- 1018 - **poisson/nbreg**

- 1019 - **xtreg**
- 1020 - **xtlogit**
- 1021 - **xtologit**
- 1022 - **cmxtmixlogit**
- 1023 - **xtpoisson**
- 1024 - **xtnbreg**
- 1025

1026 **Step 2: Explain in 2 or more sentences why you selected the model you chose.**

1027

1028 **Mini-Assignment #1: Rubric**

	0	0

1029

# Chapter 7 - Linear Models

## About

Linear models are used when your dependent (aka outcome) variable has values that range from negative infinity to positive infinity. Below is a list of real-world examples of continuous dependent variables:

- Amount of money lost or gained on the stock market.
- Number of jobs lost or gained in an economy.
- Amount of territory lost or gained in a conflict.

It is common in political science to use linear models for dependent variables that range from zero to a large positive number as well.

## Estimated Time

An estimated 120-180 minutes is needed to complete this activity.

## How do I run a linear model in Stata using political science data?

For this walkthrough, we will use the [Cooperative Congressional Election Study 2019](#) data and guide.

According to the CCES website:

- “The CCES is a 50,000+ person national stratified sample survey administered by YouGov. Half of the questionnaire consists of Common Content asked of all 50,000+ people, and half of the questionnaire consists of Team Content designed by each individual participating team and asked of a subset of 1,000 people. In addition, several teams may pool their resources to create Group Content.”
- “The survey consists of two waves in election years. In the pre-election wave, respondents answer two-thirds of the questionnaire. This segment of the survey asks about general political attitudes, various demographic factors, assessment of roll call voting choices, political information, and vote intentions. The pre-election wave is in the field from late September to late October. In the post-election wave, respondents answer the other third of the questionnaire, mostly consisting of items related to the election that just occurred. The post-election wave is administered in November.”
- “In non-election years, the survey consists of a single wave conducted in the fall.”

## 1063 Step-by-Step Walkthrough

1064 Step 1. Open Stata

1065 Step 2. Type the following command:

1066 **use "https://www.ipsrm.com/stata/CCES19\_Common\_OUTPUT.dta"**

1067 Step 3. Type the following command:

1068 **describe**

1069 Step 4. Review the output of the describe command.

1070 Step 5. Type the following command:

1071 **summarize**

1072 Step 6. Review the output of the summarize command.

1073 Step 7. In your review of the output, pay attention to the “Max” column to find a variable that  
1074 has a large number. There are variables that will not work and variables that will work to serve as  
1075 our dependent variable.

1076 Step 8. Variables that will not work include:

- 1077 a. `caseid` = unique number given to the survey respondent (the person taking the survey)
- 1078 b. `birthyr` = a survey respondent’s birth year is used to determine their age, but it is not  
1079 an interesting dependent variable
- 1080 c. `inputzip` = a survey respondent’s zip code
- 1081 d. There are others, but I just want to point out that the “Max” number is useful, but then  
1082 you need to think of the variable itself.

1083 Step 9. Variables that will work include:

- 1084 a. `faminc_new` = family income ranges from 1 (less than \$10,000) to 16 (\$500,000 or  
1085 more)
  - 1086 i. Well, the max value is actually 97, but we see that this value represents a  
1087 declined response.
- 1088 b. `child18num` = number of children 18 years or younger the respondent has. The range  
1089 of values for this variable is 1 to 20.

1090 Step 10. Let us assume our research question is: What is the relationship between party  
1091 identification and family income level?

1092 Step 11. Type the following command:

1093 **tab1 faminc\_new pid7**

1094 Step 12. Review the output.

1095 Step 13. Type the following command:

1096 **twoway (lfit faminc\_new pid7 if faminc\_new<97 & pid7<8)**

1097 Step 14. Review the graph.

1098 Step 15. Type the following command:

1099 **regress faminc\_new pid7 if faminc\_new<97 & pid7<8**

1100 Step 16. Let us review the output together:

```
. regress faminc_new pid7 if faminc_new<97 & pid7<8
```

Source	SS	df	MS	Number of obs	=	15,449
Model	362.491975	1	362.491975	F(1, 15447)	=	31.79
Residual	176150.715	15,447	11.4035551	Prob > F	=	0.0000
Total	176513.207	15,448	11.4262822	R-squared	=	0.0021
				Adj R-squared	=	0.0020
				Root MSE	=	3.3769

faminc_new	Coef.	Std. Err.	t	P> t	[95% Conf. Interval]	
pid7	.0682119	.0120985	5.64	0.000	.0444975	.0919264
_cons	5.942893	.0523558	113.51	0.000	5.84027	6.045517

Figure 7-1: Result of the regress command

1101  
1102

1103 A properly executed **regress** command, which follow the convention `regress depvar indepvars`,  
1104 (where `depvar` = dependent variable name and `indepvars` = independent variable names) will  
1105 produce the output seen above. There is a lot in this output table, but I want to focus your attention on  
1106 the following elements on the lower table:

- 1107 • `Number of obs` = number of observations include in the subset of the dataset analyzed. I say  
1108 subset because the “`if faminc_new<97 & pid7<8`” excluded some survey respondents given  
1109 how they answered those variable questions.
- 1110 • `R-squared` = one measure of the statistical relationship between the dependent variable and  
1111 independent variable(s). A higher R-square indicates a stronger relationship, while a lower R-  
1112 square indicates a weaker relationship.
- 1113 • `Coef. Column` = Coefficient estimate for the independent variable(s). `pid7` variable’s  
1114 coefficient of 0.0682119 indicates, that when there is 1-unit increase in `pid7`, there is a  
1115 0.0682119 increase in `faminc_new`. In other words, as we move from Strong Democrat to  
1116 Strong Republican, there seems to be a positive increase family income level.
- 1117 • `Std. Err. Column` = standard error estimate for the independent variable(s). Recall the [68–](#)  
1118 [95–99.7 rule](#), which means that 68% of our data falls within a -0.0120985 and +0.0120985 of the  
1119 coefficient estimate 0.0682119; 95% of our data falls within a -0.024197 and +0.024197 of the  
1120 coefficient estimate 0.0682119; and so on.
- 1121 • `t column` = t-value. A larger t-value generally means the independent variable matters more,  
1122 while a lower t-value generally means the independent variable matters less.
- 1123 • `P>|t| column` = P-values compared to absolute value of t-value. For our introductory  
1124 purposes, if a p-value is less than or equal to 0.10, and preferably 0.05, then the variable is  
1125 “statistically significant”. If the P-value is greater than 0.10, then the variable is “not statistically  
1126 significant”.

- [95% Conf. Interval] column = According to [Regression Analysis | Stata Annotated Output \(ucla.edu\)](#), “This shows a 95% confidence interval for the coefficient. This is very useful as it helps you understand how high and how low the actual population value of the parameter might be.”

Step 17. Type the following command:

```
margins, at(pid7=(1 2 3 4 5 6 7)) plot(xlabel(, labsize(small) angle(45)))
```

Step 18. Let us review the graph together:

- On the y-axis (vertical axis) of the graph, we see Linear Prediction range from 5.8 to 6.6.
- On the x-axis (horizontal axis) of the graph, from left to right, we observe the following values of Party Identification: Strong Democrat, Not very strong Democrat, Lean Democrat, Independent, Lean Republican, Not very strong Republican, and Strong Republican.
- You may be asking: “What is the `margins`” command? According to the Stata Help, “Margins are statistics calculated from predictions of a previously fit model at fixed values of some covariates and averaging or otherwise integrating over the remaining covariates.” In other words, we can use `-margins-` after fitting our model to explore the results. For example, since we fit a linear regression model above, `-margins-` computed fitted values. So what we see are the average predicted values of `faminc_new` for each of the values we specified for `pid7`.

- 1146           • One way to interpret the graph is to say as respondents move from Strong Democrat to  
 1147           Strong Republican, the average predicted family income level increases from 6.0 to 6.4.  
 1148   Step 19.   Visit [Regression Analysis | Stata Annotated Output \(ucla.edu\)](https://www.stata.com/learn/online/annotated-output/) to learn more about  
 1149           **regress**.

# Chapter 8 - Binary Outcome Models

## About

Binary outcome models are used when your dependent (aka outcome) variable has two, and only two, values. Below is a list of real-world examples of binary dependent variables:

- Did a person vote or not?
- Will a person run for elected office or not?
- Does a person support a policy position or not?

## Estimated Time

An estimated 120-180 minutes is needed to complete this activity.

## How do I run a binary outcome model in Stata using political science data?

For this walkthrough, we will continue to use the [Cooperative Congressional Election Study](#) 2019 data and guide. This will help us further familiarize ourselves with this political science dataset.

## Step-by-Step Walkthrough

Step 1. Open Stata

Step 2. Type the following command:

```
use "https://www.ipsrm.com/stata/CCES19_Common_OUTPUT.dta", clear
```

Step 3. Type the following command:

```
describe
```

Step 4. Review the output of the describe command.

Step 5. Type the following command:

```
summarize
```

Step 6. Review the output of the summarize command.

Step 7. In your review of the output, pay attention to the “Min” and “Max” column to find a variable which only has two numbers (say 0 and 1, or 1 and 2, respectively). There are variables that will not work and variables that will work to serve as our dependent variable.

Step 8. Variables that will not work include:

1191 a. `gender = gender` is unlikely to be affected by politics

1192 b. `hispanic = whether some is or identifies as Hispanic` is unlikely to be affected by

1193 politics

1194 c. `cit1 = whether someone is a U.S. citizen or not` is unlikely to be affected by politics

1195 d. Most demographic variables are unlikely to be dependent variables of interest to political

1196 scientists.

1197 Step 9. Variables that will work include:

1198 • `CC19_300_1 = Read a blog in the past 24 hours`

1199 • `CC19_300_2 = Watched TV news in past 24 hours`

1200 • `CC19_300_3 = Read a newspaper in print or online`

1201 Step 10. Let us assume our research question is: What is the relationship between party

1202 identification and reading blogs?

1203 Step 11. Type the following commands:

1204 **`gen blog = CC19_300_1`**

1205 **`replace blog = 0 if blog==2`**

1206 Step 12. The reason we generated (**gen**) the variable `blog` is because `CC19_300_1` has values of 1

1207 and 2. However, binary outcome models need the values to be 0 and 1. While we can recode the

1208 values of `CC19_300_1`, it is best practice to generate a new variable, to leave the original data

1209 intact.

1210 a. For your information, Step 11 could be completed with the following command: **`recode`**

1211 **`CC19_300_1 (2=0), generate(blog)`**

1212 Step 13. Type the following command:

1213 **`tab1 blog pid7`**

1214 Step 14. Review the output.

1215 Step 15. Type the following command:

1216 **`twoway (lfit blog pid7 if pid7<8)`**

1217 Step 16. Review the graph.

1218 Step 17. Type the following command:

1219 **`logit blog pid7 if pid7<8`**

1220 Step 18. Let us review the output together:

```
. logit blog pid7 if pid7<8
```

```
Iteration 0: log likelihood = -7695.7324
Iteration 1: log likelihood = -7687.0846
Iteration 2: log likelihood = -7687.077
Iteration 3: log likelihood = -7687.077
```

```
Logistic regression      Number of obs      =      17,433
                        LR chi2(1)          =           17.31
                        Prob > chi2         =           0.0000
Log likelihood = -7687.077 Pseudo R2          =           0.0011
```

blog	Coef.	Std. Err.	z	P> z	[95% Conf. Interval]	
pid7	-.0383256	.0092365	-4.15	0.000	-.0564288	-.0202225
_cons	-1.509651	.0391501	-38.56	0.000	-1.586384	-1.432918

Figure 8-1: Result of the logit command

1221  
1222

1223

1224 A properly executed **logit** command, which follow the convention `logit depvar indepvars`,  
1225 (where `depvar` = dependent variable name and only has values of 0 and 1, and `indepvars` =  
1226 independent variable names) will produce the output seen above. There is a lot in this output table, but I  
1227 want to focus your attention on the following elements on the lower table:

- 1228 • `Number of obs` = number of observations include in the subset of the dataset analyzed. I say  
1229 subset because the “`if pid7<8`” excluded some survey respondents given how they answered  
1230 the `pid7` variable question.
- 1231 • `Pseudo R2` = A higher pseudo R-square indicates a stronger relationship, while a lower R-  
1232 square indicates a weaker relationship
- 1233 • `Coef.` Column = According to [Logistic Regression | Stata Data Analysis Examples \(ucla.edu\)](https://www.stata.com/resources/faq/listfaq.asp?faq=111),  
1234 “The logistic regression coefficients give the change in the log odds of the outcome for a one  
1235 unit increase in the independent variable.” In this case, the log odds of reading a blog in the past  
1236 24 hours decreases as `pid7` increases from Strong Democrat to Strong Republican.
- 1237 • `Std. Err.` Column = standard error estimate for the independent variable(s). Recall the [68–](#)  
1238 [95–99.7 rule](#), which means that 68% of our data falls within a -0.0092365 and +0.0092365 of the  
1239 coefficient estimate -0.0383256; 95% of our data falls within a -0.018473 and +0.018473 of the  
1240 coefficient estimate -0.0383256; and so on.
- 1241 • `z` column = z-value. A larger z-value generally means the independent variable matters more,  
1242 while a lower z-value generally means the independent variable matters less.
- 1243 • `P>|z|` column = P-values compared to absolute value of z-value. For our introductory  
1244 purposes, if a p-value is less than or equal to 0.10, and preferably 0.05, then the variable is

1245 “statistically significant”. If the P-value is greater than 0.10, then the variable is “not statistically  
 1246 significant”.

- 1247 • [95% Conf. Interval] column = According to [Regression Analysis | Stata Annotated](#)  
 1248 [Output \(ucla.edu\)](#), “This shows a 95% confidence interval for the coefficient. This is very useful  
 1249 as it helps you understand how high and how low the actual population value of the parameter  
 1250 might be.”

1251 Step 19. Type the following command:  
 1252 `margins, at(pid7=(1 2 3 4 5 6 7)) plot(xlabel(, labsize(small) angle(ninety)))`  
 1253 Step 20. Review the graph  
 1254 Step 21. Visit [Logistic Regression | Stata Data Analysis Examples \(ucla.edu\)](#) to learn more about  
 1255 `logit`.  
 1256

## 1257 Mini-Assignment #1: Instructions

1258 **Step 1: Select a 3-step sequence subset from the 21-step process above that**  
 1259 **you find most interesting.**

- 1260 • The 3-step sequence should be sufficiently different from the prior Chapter’s mini-assignment.  
 1261

1262 **Step 2: Explain in 6 or more sentences why you selected this specific 3-step**  
 1263 **sequence.**  
 1264

# Chapter 9 - Ordinal Outcome Models

## About

Ordinal outcome models are used when your dependent (aka outcome) variable has two or more values that can be logically ordered. Below is a list of real-world examples of ordinal dependent variables:

- On a scale of 1 to 3, with 1 being low and 3 being high, how much do you support a particular candidate for public office?
- Order a set of local policy issues from least important to most important.
- On a scale from Strongly agree to Strongly disagree, what do you think of the following statement?

## Estimated Time

An estimated 120-180 minutes is needed to complete this activity.

## How do I run an ordinal outcome model in Stata using political science data?

For this walkthrough, we will continue to use the [Cooperative Congressional Election Study](https://www.ipsrm.com/stata/CCES19_Common_OUTPUT.dta) 2019 data and guide. This will help us further familiarize ourselves with this political science dataset.

## Step-by-Step Walkthrough

Step 1. Open Stata

Step 2. Type the following command:

```
use "https://www.ipsrm.com/stata/CCES19_Common_OUTPUT.dta", clear
```

Step 3. Type the following command:

```
describe
```

Step 4. Review the output of the describe command.

Step 5. There are four “Agreement” variables that lend themselves well to being considered ordinal outcomes:

- CC19\_343a = Agreement - White people have certain advantages
- CC19\_343b = Agreement - Racial problems are rare, isolated
- CC19\_343c = Agreement - Women complain about being discriminated

- 1298 • CC19\_343d = Agreement - Feminists make reasonable demands
- 1299 Step 6. Let us assume our research question is: What is the relationship between party
- 1300 identification and agreement issues related to race and/or gender?
- 1301 Step 7. Type the following command:
- 1302 **tab1 CC19\_343a CC19\_343b CC19\_343c CC19\_343d**
- 1303 Step 8. Review the output and notice the values range from:
- 1304 a. 1 – Strongly agree
- 1305 b. 2 – Somewhat agree
- 1306 c. 3 – Neither agree nor disagree
- 1307 d. 4 – Somewhat disagree
- 1308 e. 5 – Strongly disagree
- 1309 Step 9. Select one of the four “Agreement” variables that interests you as your dependent
- 1310 variable.
- 1311 Step 10. Type the following command:
- 1312 **twoway (lfit CC19\_343a pid7 if pid7<8)**
- 1313 Step 11. Let us review the graph:

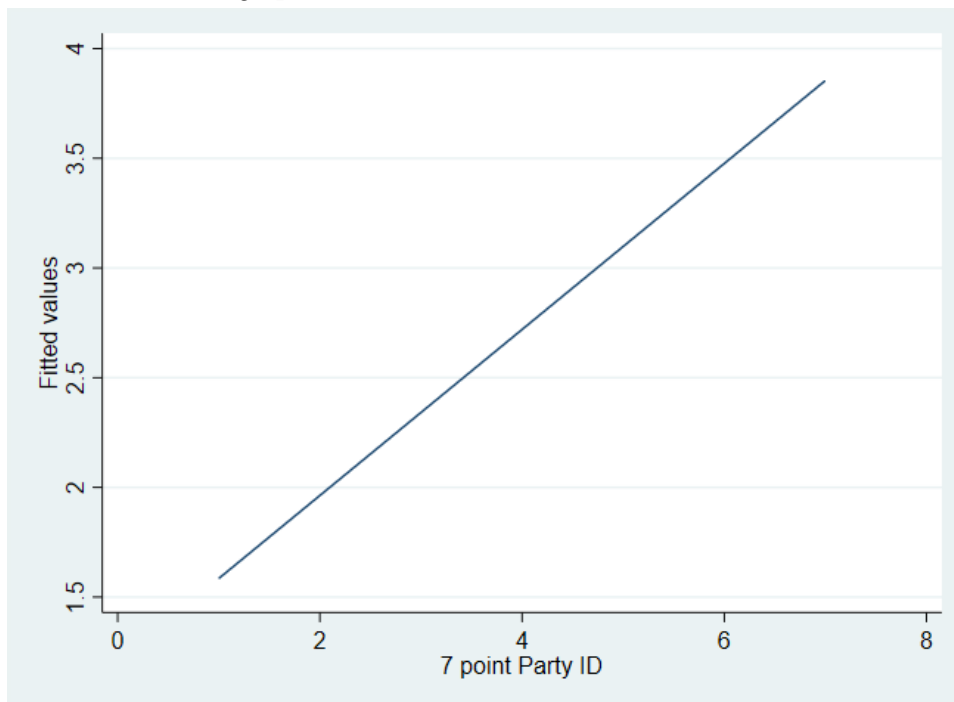

Figure 9-1: Two-way linear fit line plot

- 1314
- 1315
- 1316 • The figure shows that as we move on the `pid7` variable from Strong Democrat to Strong
  - 1317 Republican, that disagreement with the statement “White people have certain advantages”
  - 1318 increases.
- 1319 Step 12. Type the following command:
- 1320 **ologit CC19\_343a i.pid7 if pid7<8, or**
- 1321 Step 13. Let us review the output together:

```
. ologit CC19_343a i.pid7 if pid7<8, or
```

```
Iteration 0: log likelihood = -26827.42
Iteration 1: log likelihood = -23234.452
Iteration 2: log likelihood = -23138.397
Iteration 3: log likelihood = -23138.289
Iteration 4: log likelihood = -23138.289
```

```
Ordered logistic regression      Number of obs   =   17,413
                                LR chi2(6)       =   7378.26
                                Prob > chi2          =   0.0000
Log likelihood = -23138.289     Pseudo R2       =   0.1375
```

CC19_343a	Odds Ratio	Std. Err.	z	P> z	[95% Conf. Interval]	
pid7						
Not very strong Democrat	2.265066	.1164948	15.90	0.000	2.047872	2.505297
Lean Democrat	1.332694	.0720384	5.31	0.000	1.198723	1.481637
Independent	7.373517	.3523783	41.81	0.000	6.714227	8.097545
Lean Republican	24.41567	1.416525	55.07	0.000	21.79136	27.35601
Not very strong Republican	13.20005	.7405373	45.99	0.000	11.82557	14.73428
Strong Republican	23.77502	1.129162	66.72	0.000	21.66179	26.09442
/cut1	.5084542	.0298132			.4500214	.566887
/cut2	1.797562	.0335951			1.731716	1.863407
/cut3	2.790824	.0370844			2.71814	2.863508
/cut4	3.479715	.0395324			3.402232	3.557197

Note: Estimates are transformed only in the first equation.

Figure 9-2: Result of the ologit command

1322  
1323

1324

1325 A properly executed **ologit** command, which follows the convention `ologit depvar indepvars,`  
 1326 (where `depvar` = dependent variable name and has at least two ordered values and `indepvars` =  
 1327 independent variable names) will produce the output seen above. There is a lot in this output table, but I  
 1328 want to focus your attention on the following elements on the lower table:

- 1329 • Number of obs = number of observations include in the subset of the dataset analyzed. I say  
 1330 subset because the “if pid7<8” excluded some survey respondents given how they answered  
 1331 the pid7 variable question.
- 1332 • Pseudo R2 = A higher pseudo R-square indicates a stronger relationship, while a lower R-  
 1333 square indicates a weaker relationship
- 1334 • Odds Ratio Column
  - 1335 ○ Odds Ratio is not the same as Coefficient from the prior two chapters examples. Odds  
 1336 Ratio appears because we used the , or option after the **ologit** command sequence.
  - 1337 ○ An odds ratio greater than 1 means the odds are higher.
  - 1338 ○ An odds ratio lesser than 1 means the odds are lower.

1339           ○ In this example, we see the odds ratio varies by pid7 level. Therefore, someone who  
1340 identifies as Lean Democrat has 1.3 greater odds of disagreeing with the statement:  
1341 “White people have certain advantages”, while someone who identifies as Lean  
1342 Republicans is 24.4 greater odds of disagreement with the same statement.

- 1343     • Std. Err. Column = standard error estimate for the independent variable(s). Recall the [68–](#)  
1344 [95–99.7 rule](#).
- 1345     • z column = z-value. A larger z-value generally means the independent variable matters more,  
1346 while a lower z-value generally means the independent variable matters less.
- 1347     • P>|z| column = P-values compared to absolute value of z-value. For our introductory  
1348 purposes, if a p-value is less than or equal to 0.10, and preferably 0.05, then the variable is  
1349 “statistically significant”. If the P-value is greater than 0.10, then the variable is “not statistically  
1350 significant”.
- 1351     • [95% Conf. Interval] column = According to [Regression Analysis | Stata Annotated](#)  
1352 [Output \(ucla.edu\)](#), “This shows a 95% confidence interval for the coefficient. This is very useful  
1353 as it helps you understand how high and how low the actual population value of the parameter  
1354 might be.”

1355 Step 14.   Type the following command:

```
1356       margins, at(pid7=(1 2 3 4 5 6 7)) plot(xlabel(, labsize(vsmall)  

1357       angle(forty_five)) legend(order(1 "Strongly Agree" 2 "Somewhat Agree" 3  

1358       "Neither" 4 "Somewhat Disagree" 5 "Strongly Disagree")))
```

1359 Step 15.   Let us review the graph together.

1360  
1361  
1362  
1363  
1364  
1365  
1366  
1367  
1368  
1369  
1370  
1371  
1372  
1373  
1374  
1375  
1376  
1377

- This margins graph shows us the predicted probability of Strongly Agreeing to Strongly Disagreeing with the following statement “White people have certain advantages” given political party identification.
  - On the x-axis are the seven-values of pid7, ranging from “Strong Democrat” on the left to “Strong Republican” on the right.
  - On the y-axis is the probability of offering a specific “Agreement” response to the statement: “White people have certain advantages.”
  - There are 5 “Agreement” response options: Strongly Agree, Somewhat Agree, Neither Agree or Disagree, Somewhat Disagree, and Strongly Disagree.
    - We observe that someone who identifies “Strong Democrat” has a predicted probability of 60% of ranking “Strongly Agree” with the statement: “White people have certain advantages”.
    - While someone who identifies “Strong Republican” has a predicted probability near 0% of ranking “Strong Agree” with the same statement.
- Step 16. Visit [Ordered Logistic Regression | Stata Data Analysis Examples \(ucla.edu\)](https://www.stata.com/answers/1300-1400/ordered_logistic_regression/) to learn more about **ologit**.

1378 **Mini-Assignment #1: Instructions**

1379 **Step 1: Select a 3-step sequence subset from the 16-step process above that**  
1380 **you find most interesting.**

- 1381
  - The 3-step sequence should be sufficiently different from the prior Chapter’s mini-assignment.

1382

1383 **Step 2: Explain in 6 or more sentences why you selected this specific 3-step**  
1384 **sequence.**

1385

1386 **Mini-Assignment #1: Rubric**

1387

# Chapter 10 - Categorical Outcome Models

## About

Categorical outcome models are used when your dependent (aka outcome) variable has three or more values that are not naturally ordered. Below is a list of real-world examples of categorical dependent variables:

- What news sources do you read on regular basis?
- Which of the following issues are important for the government to address?
- Which of the following primary election candidates would you vote for?

## Estimated Time

An estimated 120-180 minutes is needed to complete this activity.

## How do I run a categorical outcome model in Stata using political science data?

For this walkthrough, we return to the Public Policy Institute of California's (PPIC)'s [Statewide Survey Data](#) for [January 2020 Survey Data](#).

## Step-by-Step Walkthrough

Step 1. Open Stata

Step 2. Type the following command:

```
import spss using "https://www.ipsrm.com/stata/2020.01.15.release.sav"
```

Step 3. Type the following command:

```
describe
```

Step 4. Review the output of the describe command.

Step 5. There are two "choice" variables that lend themselves well to being considered categorical outcomes:

- q17 = Thinking about these four areas of state spending...
- q19 = The state is projected to have a budget surplus...

Step 6. Let us assume our research question is: What is the relationship between homeownership status and public policy choice?

1419 Step 7. Type the following command to inspect our independent variable of homeownership  
1420 status:

1421 **tab1 d2**

1422 Step 8. Let us review the output together:

**. tab1 d2**

**-> tabulation of d2**

D2. Do you own or rent your current residence?	Freq.	Percent	Cum.
Own	<b>913</b>	<b>54.28</b>	<b>54.28</b>
Rent	<b>704</b>	<b>41.85</b>	<b>96.14</b>
[VOL] Neither	<b>65</b>	<b>3.86</b>	<b>100.00</b>
Total	<b>1,682</b>	<b>100.00</b>	

1423  
1424

*Figure 10-1: Output from tab1 d2 command*

- 1425 • d2 variable asks: “Do you own or rent your current residence?” And the answer choices are  
1426 “Own”, “Rent”, and the respondent can volunteer “Neither”.
  - 1427 ○ Own is coded as 1.
  - 1428 ○ Rent is coded as 2.
  - 1429 ○ [VOL] Neither is coded as 8.
- 1430 • We see that 54.28% of respondents own their residence, while 41.85% of respondents rent their  
1431 residence.

1432 Step 9. Type the following command to review our two possible dependent variables:

1433 **tab1 q17 q19**

1434 Step 10. Let us review the output together:

Q17. Thinking about these four areas of state spending, I'd like you to name the	Freq.	Percent	Cum.
K-to-12 public education	606	36.29	36.29
higher education	194	11.62	47.90
health and human services	699	41.86	89.76
prisons and corrections	124	7.43	97.19
[VOL] don't know	47	2.81	100.00
Total	1,670	100.00	

-> tabulation of q19

Q19. The state is projected to have a budget surplus of several billion dollars.	Freq.	Percent	Cum.
pay down debt and build up the reserve	427	25.28	25.28
increase state funding for education, h	763	45.17	70.46
one-time state spending for transportat	435	25.75	96.21
(VOL) other	41	2.43	98.64
(VOL) don't know	23	1.36	100.00
Total	1,689	100.00	

1435  
1436

Figure 10-2: Output from tab1 q17 q19 command

- 1437
- Q17 asks: “Thinking about these four areas of state spending, I’d like you to name the one you think should have the highest priority when it comes to state government spending...” and list four choices:
    - K-12 public education
    - higher education
    - health and human services
    - prisons and corrections
- 1444
- Q19 asks: “The state is projected to have a budget surplus of several billion dollars. In general, how would you prefer to use this extra money?” and lists three choices:
    - pay down the debt and build up the reserve.
    - increase state funding for education, and health and human services.
    - one-time state spending for transportation, water, infrastructure
- 1449 Step 11. Select one of the two dependent variables from above that interest you.
- 1450 Step 12. Type the following command:
- 1451 **twoway (lfit q17 d2 if d2<3)**
- 1452 Step 13. Review the graph.

1453 Step 14. Type the following command:  
 1454 `mlogit q17 i.d2 if q17<8 & d2<3`  
 1455 Step 15. Let us review the output together:

`. mlogit q17 i.d2 if q17<8 & d2<3`

Iteration 0: log likelihood = **-1817.1748**

1456  
1457

Figure 10-3: Result of the mlogit command

1458  
 1459 A properly executed `mlogit` command, which follows the convention `mlogit depvar indepvars`,  
 1460 (where `depvar` = dependent variable name and has at least three unordered values and `indepvars` =  
 1461 independent variable names) will produce the output seen above. There is a lot in this output table, but I  
 1462 want to focus your attention on the following elements on the lower table:

- 1463 • `Number of obs` = number of observations include in the subset of the dataset analyzed. I say  
 1464 subset because the “`if q17<8 & d2<3`” excluded some survey respondents given how they  
 1465 answered the `d2` variable question.
- 1466 • `Pseudo R2` = A higher pseudo R-square indicates a stronger relationship, while a lower R-  
 1467 square indicates a weaker relationship
- 1468 • `Coef.` Column

- 1469           ○ The numbers in this column are relative log-odds, so their interpretation is  
 1470 complicated.
- 1471           ○ The numbers are produced relative to the (base outcome) which is  
 1472 **health\_and\_human\_services**
- 1473           ○ For example, in the **K\_to\_12\_public\_education** row, we see Coef. -0.4543413 for  
 1474 **Rent**. This can be roughly interpreted as the following: Being a renter is associated with  
 1475 a .454 decrease in the relative log odds of choosing **K\_to\_12\_public\_education** vs.  
 1476 **health\_and\_human\_services**. In other words, it appears that a renter would prioritize  
 1477 health and human services over K-12 public education.
- 1478 ● **Std. Err.** Column = standard error estimate for the independent variable(s). Recall the [68–](#)  
 1479 [95–99.7 rule](#).
  - 1480 ● **z** column = z-value. A larger z-value generally means the independent variable matters more,  
 1481 while a lower z-value generally means the independent variable matters less.
  - 1482 ● **P>|z|** column = P-values compared to absolute value of z-value. For our introductory  
 1483 purposes, if a p-value is less than or equal to 0.10, and preferably 0.05, then the variable is  
 1484 “statistically significant”. If the P-value is greater than 0.10, then the variable is “not statistically  
 1485 significant”.
  - 1486 ● **[95% Conf. Interval]** column = According to [Regression Analysis | Stata Annotated](#)  
 1487 [Output \(ucla.edu\)](#), “This shows a 95% confidence interval for the coefficient. This is very useful  
 1488 as it helps you understand how high and how low the actual population value of the parameter  
 1489 might be.”
- 1490 Step 16.   Type the following command:
- ```
1491       margins, at(d2=(1 2)) plot(xlabel(, labsize(vsmall) angle(forty_five))  

  1492       legend(order(1 "K-to-12 public education" 2 "higher education" 3 "health and  

  1493       human services" 4 "prisons and corrections")))
```
- 1494 Step 17.   Let us review the graph together.

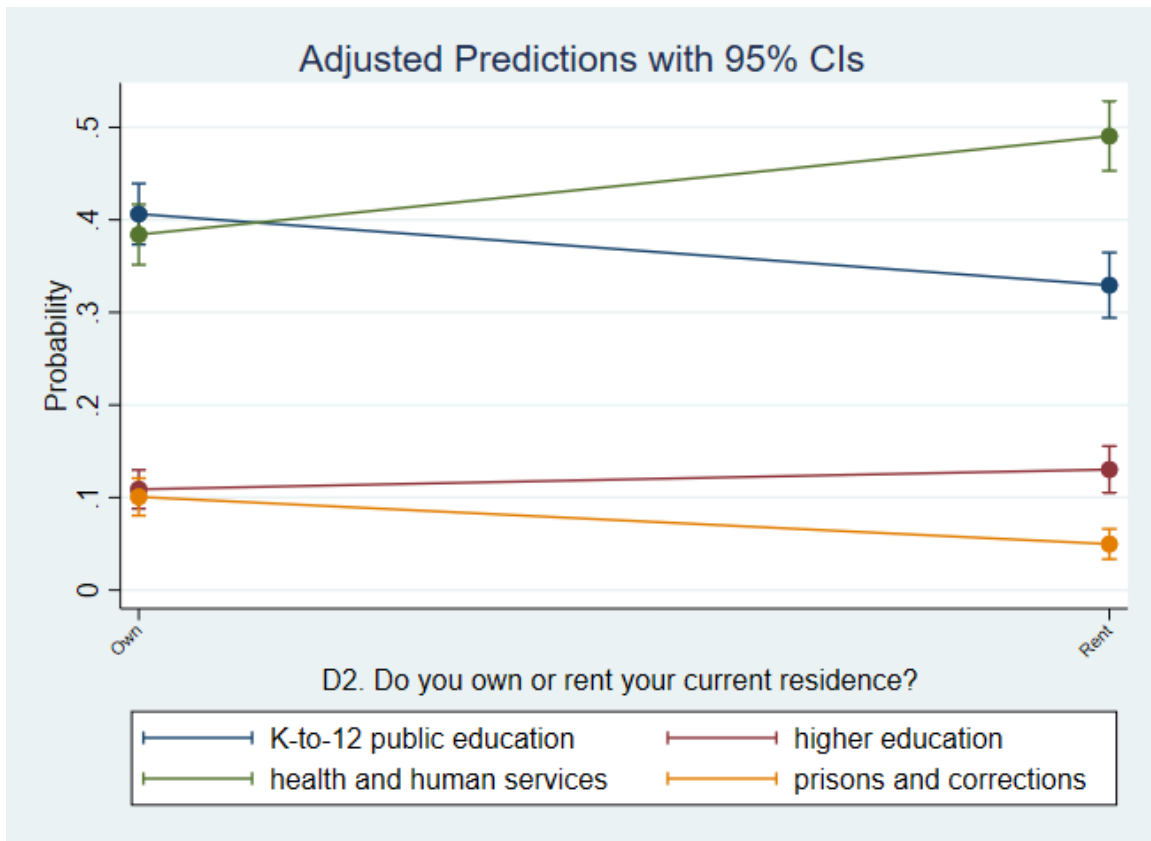

Figure 10-4: Adjusted Predictions with 95% CIs

1495  
1496

- 1497 • This margins graph shows us the predicted probability of choosing one of four policy priority
- 1498 choices given homeownership or renter status.
- 1499 • On the x-axis are the two-values of d2: Homeowner or Renter.
- 1500 • On the y-axis is the probability of choosing [1] K-to-12 public education, [2] higher education,
- 1501 [3] health and human services, or [4] prisons and corrections.
- 1502 • We observe homeowners have the following:
  - 1503 ○ ~40% predicted probability of choosing K-to-12 public education as their highest
  - 1504 priority for state spending.
  - 1505 ○ ~38% predicted probability of choosing health and human services as their highest
  - 1506 priority for state spending.
  - 1507 ○ ~10% predicted probability of choosing higher education as their highest priority for
  - 1508 state spending.
  - 1509 ○ ~10% predicted probability of choosing prisons and corrections as their highest priority
  - 1510 for state spending.
- 1511 • We observe renters have the following:
  - 1512 ○ ~32% predicted probability of choosing K-to-12 public education as their highest
  - 1513 priority for state spending.

- 1514           ○ ~49% predicted probability of choosing health and human services as their highest  
 1515           priority for state spending.  
 1516           ○ ~12% predicted probability of choosing higher education as their highest priority for  
 1517           state spending.  
 1518           ○ ~6% predicted probability of choosing prisons and corrections as their highest priority  
 1519           for state spending.  
 1520       Step 18. Visit [Multinomial Logistic Regression | Stata Annotated Output \(ucla.edu\)](https://www.stata.com/learn/annotated-output/mlogit/) to learn more  
 1521           about `mlogit`.  
 1522

1523 **Mini-Assignment #1: Instructions**

1524 **Step 1: Select a 3-step sequence subset from the 18-step process above that**  
 1525 **you find most interesting.**

- 1526       • The 3-step sequence should be sufficiently different from the prior Chapter’s mini-assignment.  
 1527

1528 **Step 2: Explain in 6 or more sentences why you selected this specific 3-step**  
 1529 **sequence.**  
 1530

1531 **Mini-Assignment #1: Rubric**

|                                                 | 1       | 15     |
|                                                 | 0       | 0      |

1532

# Chapter 11 - Count Outcome Models

## About

Count models are used when your dependent (aka outcome) variable represents a count of some object or actions and ranges from 0 to positive infinity. Below is a list of real-world examples of count dependent variables:

- How many courthouses did Congress authorize for a specific state?
- How many hearings did a state legislative committee hold in a specific legislative session?
- How many times did a U.S. citizen donate to political candidates in a campaign election cycle?

## Estimated Time

An estimated 120-180 minutes is needed to complete this activity.

## How do I run a count outcome model in Stata using political science data?

For this walkthrough, we will use a dataset that I am thoroughly familiar with because I collected the data for my dissertation: [Judicial Pork: The Congressional Allocation of Districts, Seats, Meeting Places, and Courthouses to the U.S. District Courts](#).

## Step-by-Step Walkthrough

Step 1. Open Stata

Step 2. Type the following command:

```
use "https://www.ipssrm.com/stata/Franco_Judicial_Pork_July_3_2018.dta"
```

Step 3. Type the following command:

```
describe
```

Step 4. Review the output of the describe command.

Step 5. There are four variables that lend themselves well to being considered count outcomes:

- `DpV_JDt` = Count of Judicial Districts
- `DpV_JSt` = Count of Judicial Seats
- `DpV_JMP` = Count of Judicial Meeting Places
- `DpV_JCt` = Count of Judicial Courthouses

1564 Step 6. Let us assume our research question is: What is the relationship between committee  
1565 membership and securing judicial seats?

1566 Step 7. Type the following command to inspect our independent variable of homeownership  
1567 status:

1568 **tab1 IdV\_HR\_JMbr if year==1961**

1569 Step 8. Let us review the output together:

```
. tab IdV_HR_JMbr if year==1961
```

| House<br>Judiciary<br>Member | Freq. | Percent | Cum.   |
|------------------------------|-------|---------|--------|
| 0                            | 26    | 52.00   | 52.00  |
| 1                            | 16    | 32.00   | 84.00  |
| 2                            | 7     | 14.00   | 98.00  |
| 6                            | 1     | 2.00    | 100.00 |
| Total                        | 50    | 100.00  |        |

1570  
1571

Figure 11-1: Output from `tab1 IdV_HR_JMbr if year==1961` command

- 1572
- The independent variable `IdV_HR_JMbr` tells us how many representatives a state had serving on the House Judiciary Committee.
  - This a panel dataset. To work with a cross section of this data, we can use the `if` qualifier. Here, I restricted the sample to the observations from 1961.
  - We see that 26 states had 0 representation on the committee, 16 states had 1 member, 7 states had 2 members, and 1 state has 6 members.

1577

1578 Step 9. Type the following command to review our possible dependent variable:

1579 **tab1 DpV\_JSt if year==1961**

1580 Step 10. Let us review the output together:

```
. tab1 DpV_JSt if year==1961
```

```
-> tabulation of DpV_JSt if year==1961
```

| Judicial<br>Seats | Freq. | Percent | Cum.   |
|-------------------|-------|---------|--------|
| 0                 | 20    | 40.00   | 40.00  |
| 1                 | 15    | 30.00   | 70.00  |
| 2                 | 7     | 14.00   | 84.00  |
| 3                 | 3     | 6.00    | 90.00  |
| 4                 | 3     | 6.00    | 96.00  |
| 6                 | 1     | 2.00    | 98.00  |
| 8                 | 1     | 2.00    | 100.00 |
| Total             | 50    | 100.00  |        |

Figure 11-2: Output from tab1 DpV\_JSt command

1581  
1582

- 1583 • The dependent variable DpV\_JSt tells us how many judicial seats a state was given during the  
1584 year 1961.
- 1585 • We see that 20 states were allocated no seats, 15 states received 1 seat, 7 states obtained 2 seats  
1586 and so forth.

1587 Step 11. Type the following command:

```
1588 twoway (lfit DpV_JSt IdV_HR_JMbr if year==1961)
```

1589 Step 12. Review the graph.

1590 Step 13. Type the following command:

```
1591 poisson DpV_JSt IdV_HR_JMbr if year==1961
```

1592 Step 14. Let us review the output together:

```
. poisson DpV_JSt IdV_HR_JMbr if year==1961
```

```
Iteration 0: log likelihood = -76.682465
Iteration 1: log likelihood = -72.752568
Iteration 2: log likelihood = -72.727308
Iteration 3: log likelihood = -72.727285
Iteration 4: log likelihood = -72.727285
```

```
Poisson regression      Number of obs      =      50
                        LR chi2(1)          =      24.84
                        Prob > chi2         =      0.0000
Log likelihood = -72.727285  Pseudo R2          =      0.1459
```

| DpV_JSt     | Coef.     | Std. Err. | z     | P> z  | [95% Conf. Interval] |          |
|-------------|-----------|-----------|-------|-------|----------------------|----------|
| IdV_HR_JMbr | .3899785  | .0650178  | 6.00  | 0.000 | .262546              | .5174111 |
| _cons       | -.1623412 | .1604376  | -1.01 | 0.312 | -.476793             | .1521106 |

Figure 11-3: Result of the poisson command

1593  
1594

1595

1596 A properly executed **poisson** command, which follows the convention `poisson depvar indepvars`,  
 1597 (where `depvar` = dependent variable name and has at least three unordered values and `indepvars` =  
 1598 independent variable names) will produce the output seen above. There is a lot in this output table, but I  
 1599 want to focus your attention on the following elements on the lower table:

- 1600 • Number of obs = 50 since there are 50 states in the year 1961
- 1601 • Pseudo R2 = 0.1459 demonstrates there is some relationship between these two variables
- 1602 • Coef. Column
  - 1603 ○ The numbers in this column are relative log-odds, so their interpretation is
  - 1604 complicated.
- 1605 • Std. Err. Column = standard error estimate for the independent variable(s). Recall the [68–](#)  
 1606 [95–99.7 rule](#).
- 1607 • z column = z-value. A larger z-value generally means the independent variable matters more,  
 1608 while a lower z-value generally means the independent variable matters less.
  - 1609 ○ 6.00 is a large number.
- 1610 • P>|z| column = P-values compared to absolute value of z-value. For our introductory  
 1611 purposes, if a p-value is less than or equal to 0.10, and preferably 0.05, then the variable is  
 1612 “statistically significant”. If the P-value is greater than 0.10, then the variable is “not statistically  
 1613 significant”.
  - 1614 ○ In this case, since 0.000 demonstrates a statistically significant relationship.
- 1615 • [95% Conf. Interval] column = According to [Regression Analysis | Stata Annotated](#)  
 1616 [Output \(ucla.edu\)](#), “This shows a 95% confidence interval for the coefficient. This is very useful

1617 as it helps you understand how high and how low the actual population value of the parameter  
1618 might be.”

1619 Step 15. Type the following command:

```
1620 margins, at(IdV_HR_JMbr=(0 1 2 3 4 5 6)) plot(xlabel(, labsize(vsmall)  
1621 angle(forty_five)))
```

1622 Step 16. Let us review the graph together.

Figure 11-4: Adjusted Predictions with 95% CIs

1623  
1624

1625 • This margins graph shows us the predicted number of judicial seats allocated to a state given the  
1626 number representatives a state has serving on the House Judiciary Committee.

1627 Step 17. Visit [Poisson Regression | Stata Data Analysis Examples \(ucla.edu\)](https://www.stata.com/answers/11-on-demand/114.html) to learn more about  
1628 **poisson**.

1629

## 1630 Mini-Assignment #1: Instructions

1631 **Step 1: Select a 3-step sequence subset from the 17-step process above that**  
1632 **you find most interesting.**

1633 • The 3-step sequence should be sufficiently different from the prior Chapter’s mini-assignment.

1634

1635 **Step 2: Explain in 6 or more sentences why you selected this specific 3-step**  
1636 **sequence.**

1637

1638 **Mini-Assignment #1: Rubric**

| Criteria                                        | Ratings | Points |
|-------------------------------------------------|---------|--------|
| Selected 3-step sequence                        | Yes     | 10     |
|                                                 | Missing | 0      |
| Explained selected 3-step sequence: # sentences | 6       | 90     |
|                                                 | 5       | 75     |
|                                                 | 4       | 60     |
|                                                 | 3       | 45     |
|                                                 | 2       | 30     |
|                                                 | 1       | 15     |
|                                                 | 0       | 0      |

1639

# Chapter 12 - Panel Data Linear Models

## About

Panel data linear models are used when your dependent (aka outcome) variable has values that range from negative infinity to positive infinity, *and* you are using a panel dataset. Recall a list of real-world examples of continuous dependent variables:

- Amount of money lost or gained on the stock market.
- Number of jobs lost or gained in an economy.
- Amount of territory lost or gained in a conflict.

## Panel Data: Multiple Objects across Multiple Time Periods

A panel dataset is when you are observing multiple objects across multiple time periods. Consider the following example. Say we are interested in the social, economic, and political demographics of counties in a single state over a 30-year period. Specifically, we observe the State of California and its 58 counties from 1990 to 2020. If we were just observing these 58 counties in 1990, we would have a cross-sectional dataset of 58 counties in year 1990. However, the moment we observe these same counties in 1991, we have just created a panel dataset.

|                 |                   |                   |     |                   |
|-----------------|-------------------|-------------------|-----|-------------------|
| C <sub>1</sub>  | O <sub>1990</sub> | O <sub>1991</sub> | ... | O <sub>2020</sub> |
| C <sub>2</sub>  | O <sub>1990</sub> | O <sub>1991</sub> | ... | O <sub>2020</sub> |
|                 |                   | ⋮                 |     |                   |
| C <sub>58</sub> | O <sub>1990</sub> | O <sub>1991</sub> | ... | O <sub>2020</sub> |

## Time-variant and time-invariant

The example above will help illustrate some key concepts of panel data. First, is that within Counties, there are variables that will and will not change over time. For example, variables that will change over time are the population, number of small businesses, registered Democratic versus Republican, and so on. However, there are variables that will not change over time: geographic square miles of the county, the type of county government, and the number of seats on the county Board of Supervisors.

Second, is that within time periods, there are variables that will and will not change. For example, in the year 1990, all counties may have experienced a reduction in state funding due to an economic recession. Therefore, a variable labeled “reduction in state dollars” may be labeled “Yes” for all 58 counties in year

1673 1990. However, a related variable, say “amount of reduced state dollars” can be different between  
1674 counties: County 1 experienced \$1,000,000 reduction, while County 58 had a \$5,000,000 reduction.  
1675

## 1676 **Estimated Time**

1677 An estimated 120-180 minutes is needed to complete this activity.  
1678

## 1679 **How do I run a panel data linear model in Stata** 1680 **using political science data?**

1681 For this walkthrough, we will be reproducing results from an Appendix and Figure 5 of [The](#)  
1682 [Countervailing Effects of Competition on Public Goods Provision: When Bargaining Inefficiencies Lead](#)  
1683 [to Bad Outcomes](#) by Dr. Jessica Gottlieb and Dr. Katrina Kosec. The Abstract, or summary of the article,  
1684 follows:

1685 *“Political competition is widely recognized as a mediator of public goods provision*  
1686 *through its salutary effect on incumbents’ electoral incentives. We argue that political*  
1687 *competition additionally mediates public goods provision by reducing the efficiency of*  
1688 *legislative bargaining. These countervailing forces may produce a net negative effect in*  
1689 *places with weak parties and low transparency—typical of many young democracies.*  
1690 *We provide evidence of a robust negative relationship between political competition and*  
1691 *local public goods using panel data from Mali. Tests of mechanisms corroborate our*  
1692 *interpretation of this relationship as evidence of legislative bargaining inefficiencies. To*  
1693 *explore the generalizability of these findings, we analyze cross-country panel data and*  
1694 *show that political competition leads to better (worse) public goods provision under high*  
1695 *(low) levels of party system institutionalization. The paper sheds light on why political*  
1696 *competition is only selectively beneficial and underscores the importance of considering*  
1697 *both the electoral and legislative arenas.”*

1698 In the [Supplementary Materials](#) of the article, the authors provided several statistical analyses that were  
1699 not included in the final article itself. Supplementary Materials are useful for the deeply interested  
1700 reader. Additionally, the [Replication Data for: The Countervailing Effects of Competition on Public](#)  
1701 [Goods Provision: When Bargaining Inefficiencies Lead to Bad Outcomes](#) is available on Dataverse  
1702 website.  
1703

## 1704 **Step-by-Step Walkthrough**

1705 Step 1. Open Stata

1706 Step 2. Type the following command:

1707 `use "https://www.ipsrm.com/stata/gottlieb2019.dta"`

- 1708 Step 3. Type the following command:  
 1709 **describe**  
 1710 Step 4. Review the output of the describe command. With 259 variables in this dataset, you may  
 1711 feel overwhelmed with the number of variables and their labels. However, just keep calm and  
 1712 continue.  
 1713 Step 5. Type the following command:  
 1714 **summarize**  
 1715 Step 6. Review the output of the summarize command.  
 1716 Step 7. How do the authors declare their independent variable and dependent variable? On  
 1717 page 104, Dr. Gottlieb and Dr. Kosec describe these variables:

1718 *“To test these predictions outside the Mali case, we constructed a panel dataset of 164*  
 1719 *countries spanning the period 1975–2015. Since we are interested in legislative*  
 1720 *competition, we use a Herfindahl index (HHI) for legislative elections coded from the*  
 1721 *DPI dataset (Keefer 2005) as our independent variable. For our dependent variable, we*  
 1722 *use data on both public expenditures from the Statistics on Public Expenditures for*  
 1723 *Economic Development (SPEED) database (IFPRI 2017) and on development outcomes*  
 1724 *related to public expenditures from the World Development Indicators (WDI) database*  
 1725 *(World Bank 2017) as proxies for public goods provision.”*

1726 Recall that earlier in the article, on page 93, they explain what the HHI is:

1727 *We measure electoral competitiveness in two ways: with a Herfindahl-Hirschman index*  
 1728 *(HHI) and the winning party’s margin of victory. The first better captures the idea that*  
 1729 *increasing political competitiveness exacerbates the complexity of coalition formation.*  
 1730 *The second corresponds more closely to the idea that the relative strength of the plurality*  
 1731 *party matters for its ability to form durable coalitions. Because of the way each measure*  
 1732 *is constructed, larger values indicate less political competitiveness.*

- 1733 Step 8. Type the following command:  
 1734 **xtreg gdpeducation\_ppp i.partysys2#c.herf herf t\_init\_gdpeducation\_ppp i.year**  
 1735 **population, fe cluster(ison)**  
 1736 • Let us breakdown the prior command:
- 1737 ○ **xtreg** = command for fitting linear regression model with panel data
  - 1738 ○ **gdpeducation\_ppp** = percentage of education expenditure in total GDP
  - 1739 ○ **i.partysys2#c.herf** = interaction between party system institutionalization and the  
 1740 Herfindahl Index
  - 1741 ○ **herf** = Herfindahl Index
  - 1742 ○ **t\_init\_gdpeducation\_ppp** = Initial period value of gdpeducation\_ppp interacted with  
 1743 a time trend
  - 1744 ○ **i.year** = year variable
  - 1745 ○ **population** = Population of country (100,000s)

1746 ○ , **fe cluster(ison)** = an option after the `xtreg` command that specifies fixed effects  
 1747 with clustering on country

1748  
 1749 Step 9. Let us review the command output together:

```
. xtreg gdpeducation_ppp i.partysys2#c.herf herf t_init_gdpeducation_ppp i.year population, fe cluster(ison)
```

```
Fixed-effects (within) regression      Number of obs   =    2,815
Group variable: ison                  Number of groups =    126

R-sq:                                  Obs per group:
  within = 0.1731                       min =          1
  between = 0.1911                      avg =         22.3
  overall = 0.0608                       max =          33

corr(u_i, Xb) = -0.7316                  F(36,125)       =    5.29
  Prob > F        =    0.0000
```

(Std. Err. adjusted for 126 clusters in ison)

|                         | Coef.     | Robust Std. Err. | t     | P> t  | [95% Conf. Interval] |           |
|-------------------------|-----------|------------------|-------|-------|----------------------|-----------|
| gdpeducation_ppp        |           |                  |       |       |                      |           |
| partysys2#c.herf        |           |                  |       |       |                      |           |
| 2                       | -2.077928 | .7375346         | -2.82 | 0.006 | -3.537601            | -.6182558 |
| herf                    | 1.215566  | .5541937         | 2.19  | 0.030 | .1187479             | 2.312384  |
| t_init_gdpeducation_ppp | -.0176638 | .0038305         | -4.61 | 0.000 | -.0252448            | -.0100827 |

1750  
 1751

Figure 12-1: Result of the `xtreg` command

1752 ○ Focus on the `Coef.` Column and the values for `partysys2#c.herf` and `herf`, which  
 1753 are -2.077928 and 1.215566, respectively

1754 Step 10. Now, let us compare the results from above with how it appears in the Appendix of the  
 1755 article.

Table A.20: Effect of HHI on Public Goods Provision by Party System Institutionalization

|                                                     | (1)<br>Education<br>share GDP | (2)<br>Health<br>share GDP | (3)<br>Education<br>per capita | (4)<br>Health<br>per capita | (5)<br>Primary<br>completion | (6)<br>Immunization<br>(measles) |
|-----------------------------------------------------|-------------------------------|----------------------------|--------------------------------|-----------------------------|------------------------------|----------------------------------|
| Panel A: By Party System Institutionalization (PSI) |                               |                            |                                |                             |                              |                                  |
| HHI                                                 | 1.216**<br>(0.554)            | 0.947**<br>(0.363)         | 260.497***<br>(68.004)         | 224.670***<br>(64.938)      | 9.863***<br>(3.003)          | 6.109**<br>(2.894)               |
| HHI × high PSI                                      | -2.078***<br>(0.738)          | -1.630***<br>(0.531)       | -270.844**<br>(116.932)        | -305.474***<br>(105.521)    | -11.443**<br>(5.554)         | -4.644<br>(4.320)                |
| Observations                                        | 2815                          | 2750                       | 2815                           | 2750                        | 3072                         | 4617                             |

1756  
 1757

Figure 12-2: Screenshot of Table A.20: Effect of HHI on Public Goods Provision by Party System Institutionalization

1758 ○ Looking just at column (1) Education share GDP, we see that HHI is 1.216 and  
 1759 HHI\*high PSI is -2.078

1760 ○ These numbers match those we saw in the output from the previous Stata command.

1761 Step 11. Next, we want to reproduce the top-left panel of Figure 5 in the article itself.

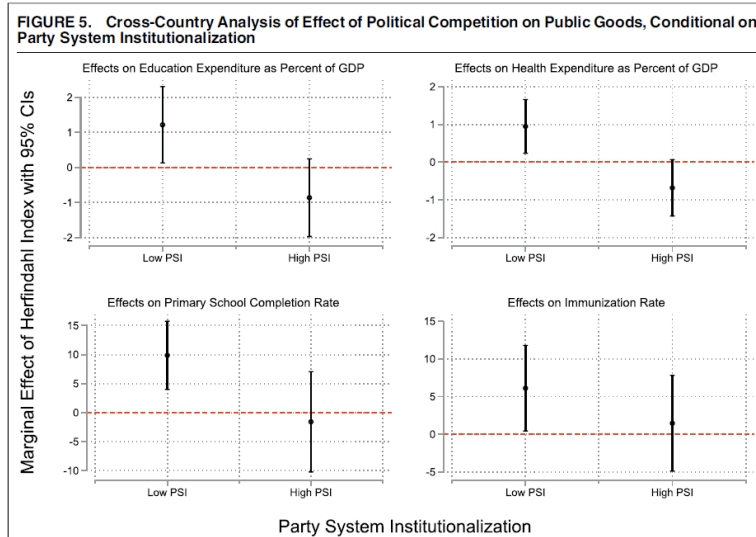

Figure 12-3: Screenshot of Figure 5: Cross-Country Analysis of Effect of Political Competition on Public Goods, Conditional on Party System Institutionalization

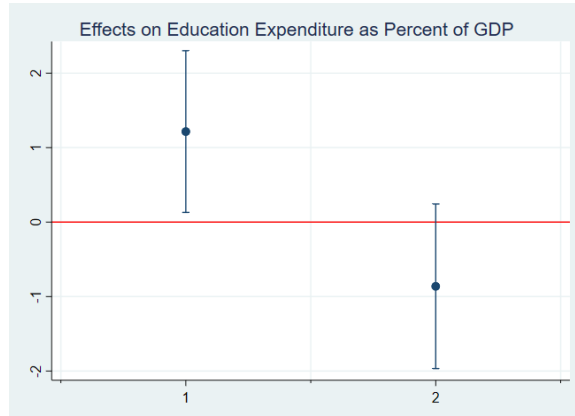

1762  
1763  
1764

Step 12. Type the following command to attempt to reproduce the top-left panel of Figure 5:

```
1766 margins, dydx(herf) by(partysys2)
1767 marginsplot, plotopts(connect(none)) name(gdped, replace) title(Effects on
1768 Education Expenditure as Percent of GDP) scheme(plotplainblind) yline(0,
1769 lcolor(red)) xlabel(, value label) xmtick(.5(1)2.5, grid gmin gmax)
1770 xsc(range(.5(1)2.5)) ytitle("") xtitle("")
```

- After you run this command, the following text and graph will appear:  
Variables that uniquely identify margins: partysys2  
(note: scheme plotplainblind not found, using s2color)

1771  
1772  
1773

1774  
1775  
1776  
1777

- This text appears because the commands in Step 12 use a community-contributed command named plotplainblind. To install this community-contributed command, type the following text in the Command window:

```
1778 ssc install blindschemes, replace
1779 net install blindschemes_fix, from(http://digital.cgdev.org/doc/stata/M0/Misc)
```

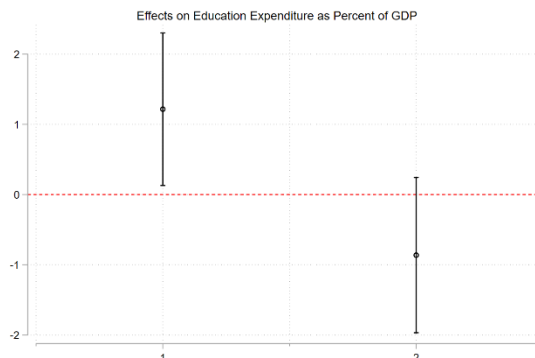

Step 13. Now, type the following command to reproduce the top-left panel of Figure 5:

```
1781 margins, dydx(herf) by(partysys2)
1782 marginsplot, plotopts(connect(none)) name(gdped, replace) title(Effects on
1783 Education Expenditure as Percent of GDP) scheme(plotplainblind) yline(0,
```

```

1784     lcolor(red)) xlabel(, value label) xmtick(.5(1)2.5, grid gmin gmax)
1785     xsc(range(.5(1)2.5)) ytitle("") xtitle("")
1786 Step 14. Let us review the graph together:

```

1787

- 1788 • Note that the graph we created has “1” instead of Low PSI and “2” instead of “High PSI”. To
- 1789 correct for this, we could include the following command in Step 12

```

1790     label define partyof2 1 "Low PSI" 2 "High PSI"
1791     label values partysys2 partyof2

```

1792 Step 15. How do Drs. Gottlieb and Kosec interpret the results from Table A.20 and Figure 5?

1793 *“Our empirical specification takes advantage of overtime changes in both legislative*  
 1794 *electoral competitiveness and public goods outcomes, running a two-way (country and*  
 1795 *year) fixed effects regression.*

1796 *We interact the time varying independent variable of competitiveness with a time-*  
 1797 *invariant country-level indicator for high party system institutionalization, which*  
 1798 *allows us to estimate differential slopes for the two sets of countries. Results appear in*  
 1799 *Appendix Table A.20 and key outcomes are depicted visually in Figure 5.*

1800 *We find strong support for our theory outside the Mali case, whether looking at public*  
 1801 *expenditures (inputs) or citizens’ access to services (outputs). In countries with low party*  
 1802 *system institutionalization, there is a positive and statistically significant relationship*  
 1803 *between the HHI and several outcomes—education and health expenditures as a share*  
 1804 *of GDP, primary school completion rates, and immunization rates for measles—*  
 1805 *indicating a negative relationship between political competition and public goods*  
 1806 *provision.*

1807 *By contrast, in countries with high party system institutionalization, this relationship*  
 1808 *either attenuates or reverses to obtain the negative relationship between the Herfindahl*  
 1809 *index and public goods outcomes (or the positive relationship between competition and*  
 1810 *public goods) that is predicted by much of the existing literature.”*

1811 Step 16. Visit [Using xtreg \(ucla.edu\)](https://ucla.edu/~xtreg/) and [What is the difference between xtreg, re and xtreg, fe? | Stata FAQ \(ucla.edu\)](https://ucla.edu/~xtreg/faq/) to learn more about **xtreg**.

1813

1814 **Mini-Assignment #1: Instructions**

1815 **Step 1: Select a 3-step sequence subset from the 16-step process above that**  
1816 **you find most interesting.**

1817

1818 **Step 2: Explain in 6 or more sentences why you selected this specific 3-step**  
1819 **sequence.**

1820

1821 **Mini-Assignment #1: Rubric**

| Criteria                                        | Ratings | Points |
|-------------------------------------------------|---------|--------|
| Selected 3-step sequence                        | Yes     | 10     |
|                                                 | Missing | 0      |
| Explained selected 3-step sequence: # sentences | 6       | 90     |
|                                                 | 5       | 75     |
|                                                 | 4       | 60     |
|                                                 | 3       | 45     |
|                                                 | 2       | 30     |
|                                                 | 1       | 15     |
|                                                 | 0       | 0      |

1822

# Chapter 13 - Panel Data Binary

## Outcome Models

### About

Binary outcome models are used when your dependent (aka outcome) variable has only two values. Previously, we fit a model with a binary outcome with cross-sectional data. Now, we will fit a binary outcome model with panel data. Below is a list of real-world examples of binary dependent variables:

- Did a person vote or not?
- Will a person run for elected office or not?
- Does a person support a policy position or not?

### Estimated Time

An estimated 120-180 minutes is needed to complete this activity.

### How do I run a panel data binary outcome model in Stata using political science data?

For this walkthrough, we will continue to use Gottlieb 2019 dataset from the chapter on Panel Data Linear Models.

### Step-by-Step Walkthrough

Step 1. Open Stata

Step 2. Type the following command:

```
use "https://www.ipssrm.com/stata/gottlieb2019.dta"
```

Step 3. Type the following command:

```
describe
```

Step 4. Review the output of the describe command. With 259 variables in this dataset, you may feel overwhelmed with the number of variables and their labels. However, just keep calm and continue.

Step 5. Type the following command:

```
summarize
```

Step 6. Review the output of the summarize command.

1853 Step 7. Let us assume our research question is: What is the relationship between country-  
 1854 legislative specific variables and whether a chief executive can serve multiple terms or not?  
 1855 Step 8. Our dependent variable is:  
 1856 a. Can chief executive serve multiple terms? = **multpl**  
 1857 Step 9. Our independent variables are:  
 1858 a. Total seats in legislature = **totalseats**  
 1859 b. Legislative elections held = **legelec**  
 1860 c. Legislative electoral competitiveness = **liec**  
 1861 Step 10. Type the following command:

```
xtlogit multpl totalseats legelec liec if multpl>=0 & legelec>=0 & liec>=0, fe
```

- Let us examine the prior command before reviewing the results:
  - The **if multpl>=0 & legelec>=0 & liec>=0** is needed because these variables have a -999 value to denote missing or incomplete information

1866 Step 11. Let us review the command output together:

```
. xtlogit multpl totalseats legelec liec if multpl>=0 & legelec>=0 & liec>=0, fe  

note: multiple positive outcomes within groups encountered.  

note: 153 groups (4,743 obs) dropped because of all positive or  

all negative outcomes.
```

```
Iteration 0: log likelihood = -255.05206  

Iteration 1: log likelihood = -250.7424  

Iteration 2: log likelihood = -250.68856  

Iteration 3: log likelihood = -250.68853  

Iteration 4: log likelihood = -250.68853
```

```
Conditional fixed-effects logistic regression      Number of obs      =      537  

Group variable: ison                          Number of groups   =      15  
  

Obs per group:  

   min =      21  

   avg =      35.8  

   max =      41  
  

LR chi2(3) =      90.48  

Log likelihood = -250.68853                    Prob > chi2        =      0.0000
```

| multpl     | Coef.            | Std. Err.       | z            | P> z         | [95% Conf. Interval] |                  |
|------------|------------------|-----------------|--------------|--------------|----------------------|------------------|
| totalseats | <b>-.0063398</b> | <b>.003649</b>  | <b>-1.74</b> | <b>0.082</b> | <b>-.0134917</b>     | <b>.0008121</b>  |
| legelec    | <b>-.0592558</b> | <b>.2419897</b> | <b>-0.24</b> | <b>0.807</b> | <b>-.5335469</b>     | <b>.4150353</b>  |
| liec       | <b>-.9580906</b> | <b>.1705042</b> | <b>-5.62</b> | <b>0.000</b> | <b>-1.292273</b>     | <b>-.6239085</b> |

Figure 13-1: Result of the xtlogit command

1867  
 1868  
 1869 ○ Notice the two “Notes”:

- 1870                   ▪ The first note is saying that within country, there are years when the chief
- 1871                   executive can serve multiple terms and years when the chief executive cannot
- 1872                   serve multiple terms. Thus, for some panels there are multiple observations for
- 1873                   which the dependent variable is equal to one.
- 1874                   ▪ The second note is saying 153 countries were dropped from the analysis because
- 1875                   every year the chief executive cannot serve multiple terms, or every year the
- 1876                   chief executive can serve multiple terms. In other words, there is no variation on
- 1877                   the dependent variable of interest.
- 1878                   ○ Focus on the Coef. Column:
  - 1879                   ▪ `totalseats` is -0.0063398 with  $P > |z|$  of 0.082.
  - 1880                   ▪ `legelec` is -0.0592558 with  $P > |z|$  of 0.807.
  - 1881                   ▪ `liec` is -0.9580906 with  $P > |z|$  of 0.000.

Step 12. Type the following command to produce a graph:

**margins, at(liec=(1 2 3 4 5 6 7)) plot**

Step 13. Let us review the graph together:

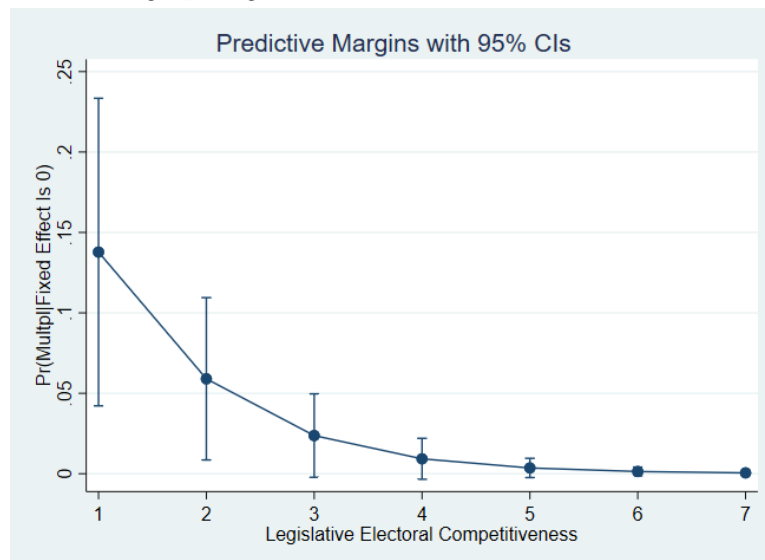

Figure 13-2: Predictive Margins with 95% CIs

- 1885
- 1886
- 1887                   • As legislative electoral competitiveness increases, the probability of a chief executive being able
- 1888                   to serve multiple terms decreases.

Step 14. Visit [Longitudinal-Data/Panel-Data Reference Manual | Stata Press \(stata-press.com\)](http://stata-press.com) to learn more about **xtlogit**.

1891

1892 **Mini-Assignment #1: Instructions**

1893 **Step 1: Select a 3-step sequence subset from the 14-step process above that**  
1894 **you find most interesting.**

1895  
1896 **Step 2: Explain in 6 or more sentences why you selected this specific 3-step**  
1897 **sequence.**

1898  
1899 **Mini-Assignment #1: Rubric**

| Criteria                                        | Ratings | Points |
|-------------------------------------------------|---------|--------|
| Selected 3-step sequence                        | Yes     | 10     |
|                                                 | Missing | 0      |
| Explained selected 3-step sequence: # sentences | 6       | 90     |
|                                                 | 5       | 75     |
|                                                 | 4       | 60     |

# Chapter 14 - Panel Data Ordinal Outcome Models

## About

Ordinal outcome models are used when your dependent (aka outcome) variable has two or more values that can be logically ordered. Previously, we fit a model with an ordinal outcome with cross-sectional data. Now we'll fit an ordinal outcome model with panel data. Below is a list of real-world examples of ordinal dependent variables:

- On a scale of 1 to 3, with 1 being low and 3 being high, how much do you support a particular candidate for public office?
- Order a set of local policy issues from least important to most important.
- On a scale from Strongly agree to Strongly disagree, what do you think of the following statement?

## Estimated Time

An estimated 120-180 minutes is needed to complete this activity.

## How do I run a panel data ordinal outcome model in Stata using political science data?

For this walkthrough, we will continue to use Gottlieb 2019 dataset from the chapter on Panel Data Linear Models and Binary Outcome Models.

## Step-by-Step Walkthrough

Step 1. Open Stata

Step 2. Type the following command:

```
use "https://www.ipsrm.com/stata/gottlieb2019.dta"
```

Step 3. Type the following command:

```
describe
```

Step 4. Review the output of the describe command. With 259 variables in this dataset, you may feel overwhelmed with the number of variables and their labels. However, just keep calm and continue.

Step 5. Type the following command:

1933           **summarize**

1934   Step 6.     Review the output of the summarize command.

1935   Step 7.     Let us assume our research question is: What is the relationship between country-

1936           legislative specific variables and the level of legislative electoral competitiveness?

1937   Step 8.     Our dependent variable is:

1938           a.   Legislative electoral competitiveness = **liec**

1939   Step 9.     Our independent variables are:

1940           a.   Total seats in legislature = **totalseats**

1941           b.   Proportional representation system = **pr**

1942           c.   Media bias = **v2mebias**

1943   Step 10.    We need to replace `liec` values that are not whole numbers (3.5, 5.5, and 6.5) because

1944           there is a reporting error when we try to **margins** plot the estimation results:

1945           **replace liec=4 if liec==3.5**

1946           **replace liec=6 if liec==5.5**

1947           **replace liec=7 if liec==6.5**

1948   Step 11.    Type the following command:

1949           **xtologit liec totalseats pr v2mebias if liec>=0 & pr>=0**

1950   •   Let us examine the prior command before reviewing the results:

1951           ○   The **if liec>=0 & pr>=0** is needed because these variables have a -999 value to denote

1952           missing or incomplete information

1953   Step 12.    Let us review the command output together:

```

Random-effects ordered logistic regression      Number of obs   =    4,401
Group variable: ison                          Number of groups =    157

Random effects u_i ~ Gaussian                 Obs per group:
  min =          3
  avg =         28.0
  max =         41

Integration method: mvaghermite               Integration pts. =    12

Log likelihood = -1767.8579                   Wald chi2(3)    =    337.70
  Prob > chi2    =    0.0000

```

| liec       | Coef.             | Std. Err.       | z            | P> z         | [95% Conf. Interval] |                  |
|------------|-------------------|-----------------|--------------|--------------|----------------------|------------------|
| totalseats | <b>-0.0010904</b> | <b>.0011074</b> | <b>-0.98</b> | <b>0.325</b> | <b>-0.0032609</b>    | <b>.0010801</b>  |
| pr         | <b>1.499522</b>   | <b>.2430959</b> | <b>6.17</b>  | <b>0.000</b> | <b>1.023062</b>      | <b>1.975981</b>  |
| v2mebias   | <b>1.531166</b>   | <b>.0945023</b> | <b>16.20</b> | <b>0.000</b> | <b>1.345945</b>      | <b>1.716387</b>  |
| /cut1      | <b>-8.861536</b>  | <b>.5151242</b> |              |              | <b>-9.871161</b>     | <b>-7.851911</b> |
| /cut2      | <b>-8.059862</b>  | <b>.4852102</b> |              |              | <b>-9.010856</b>     | <b>-7.108867</b> |
| /cut3      | <b>-5.71674</b>   | <b>.4362924</b> |              |              | <b>-6.571857</b>     | <b>-4.861622</b> |
| /cut4      | <b>-4.206457</b>  | <b>.4174544</b> |              |              | <b>-5.024653</b>     | <b>-3.388261</b> |
| /cut5      | <b>-1.200217</b>  | <b>.4048179</b> |              |              | <b>-1.993646</b>     | <b>-.4067888</b> |
| /sigma2_u  | <b>11.00525</b>   | <b>2.078085</b> |              |              | <b>7.600996</b>      | <b>15.93418</b>  |

```
LR test vs. ologit model: chibar2(01) = 1404.22      Prob >= chibar2 = 0.0000
```

Figure 14-1: Result of the xtologit command

1954  
1955

1956

o Focus on the Coef. Column:

1957

▪ totalseats is -0.0010 with P>|z| of 0.325, which is not statistically significant.

1958

▪ pr is +1.4995 with P>|z| of 0.000, which suggests countries with proportional representation electoral systems are more competitive.

1959

1960

▪ v2mebias is +1.5311 with P>|z| of 0.000, which suggests that as media bias shifts from left to right, legislative competitiveness increases.

1961

1962

Step 13. Type the following command to produce a graph:

1963

**margins, at(v2mebias=(-3 -2 -1 0 1 2 3)) plot**

1964

Step 14. Let us review the graph together:

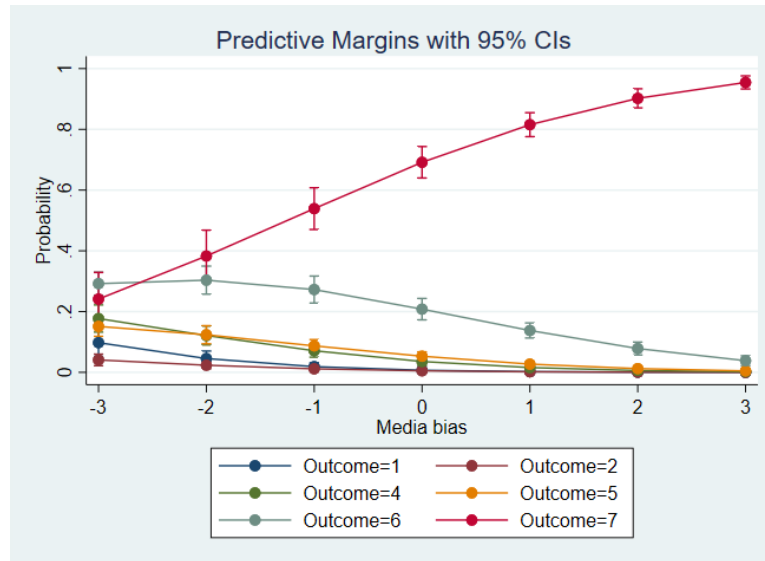

Figure 14-2: Predictive margins with 95% CI

1965  
1966

1967  
1968

- Given that there are 7 outcomes, or levels, of legislative electoral competitiveness, we need to observe each line:

1969  
1970

- Outcomes 1-6 demonstrate that as media bias shifts from left to right, the probability of legislative electoral competitiveness decreases.

1971

- Note that Outcome 3 is not included in the predictive margins above. To check this for yourself, you can type the following command: `tabulate liec if pr>=0`

1972

1973

1974

- Outcome 7 demonstrates that as media bias shifts from left to right, the probability of legislative electoral competitiveness increases.

1975

1976

- Step 15. Visit [Longitudinal-Data/Panel-Data Reference Manual | Stata Press \(stata-press.com\)](https://www.stata.com/manuals/longitudinal-data-panel-data-reference-manual/) to learn more about `xtologit`.

1977

1978

- Step 16. You can also watch [Ordered logistic and probit for panel data in Stata® - YouTube](https://www.youtube.com/watch?v=...)

## Mini-Assignment #1: Instructions

1981

**Step 1: Select a 3-step sequence subset from the 16-step process above that you find most interesting.**

1982

1983

1984

**Step 2: Explain in 6 or more sentences why you selected this specific 3-step sequence.**

1985

1986

1987

## Mini-Assignment #1: Rubric

| Criteria | Ratings | Points |
|----------|---------|--------|
|----------|---------|--------|

|                                                    |         |    |
|----------------------------------------------------|---------|----|
| Selected 3-step sequence                           | Yes     | 10 |
|                                                    | Missing | 0  |
| Explained selected 3-step<br>sequence: # sentences | 6       | 90 |
|                                                    | 5       | 75 |
|                                                    | 4       | 60 |
|                                                    | 3       | 45 |
|                                                    | 2       | 30 |
|                                                    | 1       | 15 |
|                                                    | 0       | 0  |

1988

# Chapter 15 - Panel Data

## Categorical Outcome Models

### About

Categorical outcome models are used when your dependent (aka outcome) variable has three or more values that are not naturally ordered. In Chapter 10, we fit a categorical outcome model with cross-sectional data. Below, we will discuss how to fit a categorical outcome model with panel data. Below is a list of real-world examples of categorical dependent variables:

- What news sources do you read on regular basis?
- Which of the following issues are important for the government to address?
- Which of the following primary election candidates would you vote for?

In Stata, these types of models are called panel-data mixed logit choice models and can be fit with the `cmxtmixlogit` command.

### Estimated Time

An estimated 120-180 minutes is needed to complete this activity.

### How do I create a panel dataset to fit a mixed logit choice model?

Unlike the prior chapters, panel data for mixed logit choice models are more complicated. After scouring open access journal articles and associated datasets, searching Dataverse, trying to access walled-off data at ICPSR and ANES, and a couple of other apolitical sources, I reached the conclusion that there is not suitable panel dataset to conduct a panel-data mixed logit choice model for walkthrough purposes.

Instead of accepting that I fruitlessly spent about 2 hours searching through articles and datasets, I am going to make lemonade out of lemons and use Stata Manual's example for the `cmxtmixlogit` to analogize a potential political science-oriented dataset.

### Step-by-Step Walkthrough

- Step 1. Visit [Panel-data mixed logit | New in Stata 16](#)

- 2020 Step 2. Watch [Choice models - YouTube](#)
- 2021 Step 3. Download the Stata Manual for [\[CM\] cmxtmixlogit](#).
- 2022 a. Scroll to page 6 and let us observe Example 1: Panel-data mixed logit model with
- 2023 alternative- and case-specific covariates.
- 2024 Step 4. Let us observe how the Transportation choice data is organized:

```
. use https://www.stata-press.com/data/r16/transport
(Transportation choice data)
. list in 1/12, sepby(t)
```

|     | id | t | alt     | choice | trcost | trtime | age | income | parttime  |
|-----|----|---|---------|--------|--------|--------|-----|--------|-----------|
| 1.  | 1  | 1 | Car     | 1      | 4.14   | 0.13   | 3.0 | 3      | Full-time |
| 2.  | 1  | 1 | Public  | 0      | 4.74   | 0.42   | 3.0 | 3      | Full-time |
| 3.  | 1  | 1 | Bicycle | 0      | 2.76   | 0.36   | 3.0 | 3      | Full-time |
| 4.  | 1  | 1 | Walk    | 0      | 0.92   | 0.13   | 3.0 | 3      | Full-time |
| 5.  | 1  | 2 | Car     | 1      | 8.00   | 0.14   | 3.2 | 5      | Full-time |
| 6.  | 1  | 2 | Public  | 0      | 3.14   | 0.12   | 3.2 | 5      | Full-time |
| 7.  | 1  | 2 | Bicycle | 0      | 2.56   | 0.18   | 3.2 | 5      | Full-time |
| 8.  | 1  | 2 | Walk    | 0      | 0.64   | 0.39   | 3.2 | 5      | Full-time |
| 9.  | 1  | 3 | Car     | 1      | 1.76   | 0.18   | 3.4 | 5      | Part-time |
| 10. | 1  | 3 | Public  | 0      | 2.25   | 0.50   | 3.4 | 5      | Part-time |
| 11. | 1  | 3 | Bicycle | 0      | 0.92   | 1.05   | 3.4 | 5      | Part-time |
| 12. | 1  | 3 | Walk    | 0      | 0.58   | 0.59   | 3.4 | 5      | Part-time |

Figure 15-1: Output of use <https://www.stata-press.com/data/r16/transport> command

2025  
2026

- 2027 Step 5. Now, let us create an analogous dataset, but instead of transportation choice, let us
- 2028 consider choice of primary presidential candidate.

| id | t | alt       | choice | cand_ideo | cand_age | cand_race | cand_gender | resp_age | resp_race | resp_gender | resp_edu |
|----|---|-----------|--------|-----------|----------|-----------|-------------|----------|-----------|-------------|----------|
| 1  | 1 | Biden     | 0      | 0         | 78       | White     | male        | 35       | Latino    | male        | College  |
| 1  | 1 | Buttigieg | 0      | -1        | 38       | White     | male        | 35       | Latino    | male        | College  |
| 1  | 1 | Sanders   | 1      | -3        | 79       | White     | male        | 35       | Latino    | male        | College  |
| 1  | 1 | Warren    | 0      | -2        | 71       | White     | female      | 35       | Latino    | male        | College  |
| 1  | 2 | Biden     | 0      | 0         | 78       | White     | male        | 35       | Latino    | male        | College  |
| 1  | 2 | Buttigieg | 0      | -1        | 38       | White     | male        | 35       | Latino    | male        | College  |
| 1  | 2 | Sanders   | 0      | -3        | 79       | White     | male        | 35       | Latino    | male        | College  |
| 1  | 2 | Warren    | 1      | -2        | 71       | White     | female      | 35       | Latino    | male        | College  |
| 1  | 3 | Biden     | 0      | 0         | 78       | White     | male        | 35       | Latino    | male        | College  |
| 1  | 3 | Buttigieg | 0      | -1        | 38       | White     | male        | 35       | Latino    | male        | College  |
| 1  | 3 | Sanders   | 0      | -3        | 79       | White     | male        | 35       | Latino    | male        | College  |
| 1  | 3 | Warren    | 1      | -2        | 71       | White     | female      | 35       | Latino    | male        | College  |

Figure 15-2: Screenshot of Choice of Primary Presidential Candidate dataset

2029  
2030

- 2031 • id = unique id for the respondent of a survey that occurs over a 3-month period
- 2032 • t = time period in months
- 2033 • alt = alternatives or choices available to the respondent

- 2034 • choice = is a 0/1 indicator of the candidate the respondent chose. Only 1 of the 4 choices can be
- 2035 marked with 1, the other three choices are marked 0.
- 2036 • cand\_ideo = The candidate’s ideology on a scale from -3 (most liberal) to 0 (moderate)
- 2037 • cand\_age = Age of the candidate
- 2038 • cand\_race = Race of the candidate
- 2039 • cand\_gender = Gender of the candidate
- 2040 • resp\_age = Age of respondent
- 2041 • resp\_race = Race of respondent
- 2042 • resp\_gender = Gender of respondent
- 2043 • resp\_edu = Education level of the respondent
- 2044 Step 6. Instead of Primary President Candidate choices, we could consider California primary
- 2045 statewide elected candidate choices for U.S. Senator, governor, lieutenant governor, attorney
- 2046 general, insurance commission, secretary of state, state controller, state treasurer, and
- 2047 superintendent of public instruction.
- 2048 Step 7. Both prior examples are “high profile”; however, what could be other political choices?
- 2049

## 2050 Mini-Assignment #1: Instructions

|                                                 | Missing | 0      |
| Explained selected 3-step sequence: # sentences | 6       | 90     |
|                                                 | 5       | 75     |
|                                                 | 4       | 60     |
|                                                 | 3       | 45     |
|                                                 | 2       | 30     |
|                                                 | 1       | 15     |
|                                                 | 0       | 0      |

# Chapter 16 - Panel Data Count Outcome Models

## About

Count models are used when your dependent (aka outcome) variable represents a count of some object or actions and ranges from 0 to positive infinity. Previously, we fit a count outcome model with cross-sectional data in Chapter 11. Now we will fit a count outcome model with panel data. Below is a list of real-world examples of count dependent variables:

- How many courthouses did Congress authorize for a specific state?
- How many hearings did a state legislative committee hold in a specific legislative session?
- How many times did a U.S. citizen donate to political candidates in a campaign election cycle?

## Estimated Time

An estimated 120-180 minutes is needed to complete this activity.

## How do I run a panel data count outcome model in Stata using political science data?

For this walkthrough, we will return to a [Judicial Pork: The Congressional Allocation of Districts, Seats, Meeting Places, and Courthouses to the U.S. District Courts](#) dataset that I am thoroughly familiar with because I collected the data for my dissertation.

## Step-by-Step Walkthrough

Step 1. Open Stata

Step 2. Type the following command:

```
use "https://www.ipsrm.com/stata/Franco_Judicial_Pork_July_3_2018.dta"
```

Step 3. Let us assume our research question is: What is the relationship between committee leadership and majority and minority committee members and securing judicial seats?

Step 4. Our dependent variable is:

- `DpV_JSt` = Count of Judicial Seats

Step 5. Our independent variables are:

- Senate Judiciary Chair = `IdV_S_JChair`
- Senate Judiciary Majority Member = `IdV_S_JMbr_Maj`

- 2089 • Senate Judiciary Minority Member = IdV\_S\_JMbr\_Min
- 2090 • House Judiciary Chair = IdV\_HR\_JChair
- 2091 • House Judiciary Majority Member = IdV\_HR\_JMbr\_Maj
- 2092 • House Judiciary Minority Member = IdV\_HR\_JMbr\_Min
- 2093 • Judicial Vacancies = Ctrl\_JVac

2094 Step 6. Type the following command:

```
2095 xtnbreg DpV_JSt IdV_S_JChair IdV_S_JMbr_Maj IdV_S_JMbr_Min IdV_HR_JChair
2096 IdV_HR_JMbr_Maj IdV_HR_JMbr_Min Ctrl_JVac if DpV_JSt>=0, fe irr
```

2097 Step 7. Let us review the output together:

```
. xtnbreg DpV_JSt IdV_S_JChair IdV_S_JMbr_Maj IdV_S_JMbr_Min IdV_HR_JChair IdV_HR_JMbr_Maj IdV_HR_JMbr_Min Ctrl
> _JVac if DpV_JSt>=0, fe irr
```

```
Iteration 0: log likelihood = -2063.1075
Iteration 1: log likelihood = -1865.8168
Iteration 2: log likelihood = -1857.7928
Iteration 3: log likelihood = -1857.6737
Iteration 4: log likelihood = -1857.6734
Iteration 5: log likelihood = -1857.6734
```

```
Conditional FE negative binomial regression      Number of obs   =      8,705
Group variable: id_icpsr_st~de                  Number of groups =      50
```

```
Obs per group:
      min =      56
      avg =     174.1
      max =     226
```

```
Log likelihood = -1857.6734      Wald chi2(7)     =      27.37
                                Prob > chi2          =      0.0003
```

| DpV_JSt         | IRR      | Std. Err. | z      | P> z  | [95% Conf. Interval] |          |

Figure 16-1: Result of the xtnbreg command

- 2098 • IRR Column
- 2099
  - IRR stands for incidence rate ratio. <1 means a % decrease in incidence rate of being allocated judicial pork while >1 means a % increase in incidence rate of being allocated judicial pork.
- 2100 • P>|z|: The following three independent variables have a P>|z| less than 0.10.
- 2101
  - House Judiciary Committee majority member
  - 2102 ○ House Judiciary Committee minority member
  - 2103 ○ Judicial vacancies

2109 Step 8. Visit [Negative Binomial Regression | Stata Data Analysis Examples \(ucla.edu\)](https://www.stata.com/answers/1300/1300000.html) to learn  
2110 more about `nbreg`.

2111

## 2112 Mini-Assignment #1: Instructions

2113 Step 1: Select a 3-step sequence subset from the 8-step process above that you  
2114 find most interesting.

2115

2116 Step 2: Explain in 6 or more sentences why you selected this specific 3-step  
2117 sequence.

2118

## 2119 Mini-Assignment #1: Rubric

| Criteria                                        | Ratings | Points |
|-------------------------------------------------|---------|--------|
| Selected 3-step sequence                        | Yes     | 10     |
|                                                 | Missing | 0      |
| Explained selected 3-step sequence: # sentences | 6       | 90     |
|                                                 | 5       | 75     |
|                                                 | 4       | 60     |
|                                                 | 3       | 45     |
|                                                 | 2       | 30     |
|                                                 | 1       | 15     |
|                                                 | 0       | 0      |

# Chapter 17 - Survival Models

## About

Survival models, which are also known as duration models or event history models, are used when your dependent (aka outcome) variable represents a time-to-event which ranges from 0 to some large positive number. Below is a list of real-world examples of survival dependent variables:

- How long will a candidate for president stay in the race before dropping out?
- How long does it take for a bill to become law?
- How long does a Cabinet-level appointee stay in their position before resigning?

## Estimated Time

An estimated 120-180 minutes is needed to complete this activity.

## How do I interpret the statistical output of a survival model?

Normally, we explore how to run an empirical model in Stata using political science data. However, for survival models, I want you to read the following excerpt from a draft of my dissertation that explains the output of two types of survival models.

Binary outcome models determine what effect covariates have on the allocation of judicial pork to a state. However, judicial pork is a rare event, like discovering gold or riding in a helicopter, so we may be interested in how covariates affect the time until Congress allocates a state judicial pork.

Survival models are known as event history models, duration models, or time-to-event models (Allison, 2014; Box-Steffensmeier & Jones, 2004). Survival models can be used to answer the question: *given a set of covariates, how long will a state survive without obtaining judicial pork?*

There are two types of survival models to consider: Panel parametric survival model and Cox semi-parametric survival model. The primary difference is that parametric models assume a distribution (exponential or Weibull) to determine the hazard rate, while semi-parametric models do not make a distributional assumption.

2154 Depending on the nature of the event(s) of interest (Metzger & Jones, 2016), it matters  
2155 which survival model specification is used to estimate results. Given that states can  
2156 repeatedly experience the allocation of a type of judicial pork, the use of a semi-parametric  
2157 Cox model specified as clustered or shared frailty is most appropriate (Box-Steffensmeier,  
2158 Linn, & Smidt, 2014; Cleves, 2017).

2159  
2160 The cluster specification accounts for intra-state correlation through the standard errors  
2161 while the shared frailty specification accounts for intra-state correlation through the  
2162 hazard function (Cleves, 2017). It is possible to use parametric survival models, but this  
2163 would impose restrictive assumptions (Box-Steffensmeier & De Boef, 2006; Box-  
2164 Steffensmeier et al., 2014; Box-Steffensmeier & Zorn, 2002).

2165  
2166 The table below shows the results of Clustered (CL) versus Shared Frailty (SF) Cox Models  
2167 by Judicial Pork Type. While both model specifications are present in the table, the  
2168 analysis for Districts will be focused on clustered (CL) version, while my analysis for Seats,  
2169 Meeting Places, and Courthouses will focus on the shared frailty (SF) version. The reason  
2170 is that shared frailty cannot be ruled out for the latter three, while it can be ruled out for  
2171 Districts.<sup>2</sup>

2172  
2173 This table reports hazard rates instead of standard beta coefficients. A hazard rate above  
2174 one means that a state's rate of obtaining judicial pork increases, while a rate below one  
2175 means that a state's rate decreases. First, we find that Senate Judiciary Committee  
2176 Chairmanship is not statistically significant across any of the models.

2177  
2178 This result corresponds with the fixed-effect logit models. Second, a state having a Senator  
2179 on the Judiciary Committees or holding the House Judiciary Committee Chairmanship  
2180 increases the rate of securing courthouses by 28% and 69%, respectively. Third, states with  
2181 rank-and-file representatives on the House Judiciary Committee increases the rate of  
2182 securing a Judicial District by 65%, a Meeting Place by 16%, and a Courthouse by 17%.  
2183 However, this covariate is not statistically significant for Judicial Seats within the shared  
2184 frailty (SF) model.

2185  
2186 A one-unit change in Judicial Vacancies decreases the rate of which a state is allocated a  
2187 Seat and Courthouse by 34% and 74%, respectively. Unlike the across-the-board positive  
2188 effect of Unified Government, in the survival models we find that it only has a positive  
2189 effect for Seats and Meeting Places, but not Districts or Courthouses.

---

<sup>2</sup> This is based on a likelihood-ratio test that  $H_0: \theta=0$

Table 17-1: Clustered (CL) versus Shared Frailty (SF) Cox Models by Judicial Pork Type

|                                         | Hypothesized Value | Districts CL      | Districts SF        | Seats CL           | Seats SF           | Meeting Places CL  | Meeting Places SF | Courthouses CL      | Courthouses SF     |

# Chapter 18 - Share

2200

2201

## 2202 About

2203 Share is an opportunity for you to share with your peers any of your Polimetrics Chapter Assignments.

2204

## 2205 Estimated Time

2206 An estimated 90-120 minutes is needed to complete this activity.

2207

## 2208 Instructions

### 2209 Post

- 2210 • Specify which Polimetrics Chapter Assignment you are sharing with the class.
- 2211 • In 3 or more sentences, explain why you wanted to share this assignment, compared to other,  
2212 chapter assignments.
- 2213 • Ask a specific question that you would like a peer to reply to. Examples of questions include:
  - 2214 ○ What do you think of my submission for a specific assignment?
  - 2215 ○ How is my explanation similar to what you wrote for the same assignment?
  - 2216 ○ How is my explanation different from what you wrote for the same assignment?
  - 2217 ○ What is a strength of my submission for the specific assignment?
  - 2218 ○ What is an area I could expand upon for the specific assignment?

2219

### 2220 Reply to a Peer’s Post

- 2221 • In 3 or more sentences, respond to the question your peer asked in their original post.

2222

## 2223 Rubric

| Criteria                                     | Ratings     | Points |
|----------------------------------------------|-------------|--------|
| Post: Assignment specified                   | Yes         | 20     |
|                                              | No          | 0      |
| Post: Why You Chose to Share this Assignment | 3 sentences | 30     |
|                                              | 2 sentences | 20     |
|                                              | 1 sentence  | 10     |
|                                              | Missing     | 0      |

|                                                   |                   |    |

|                                                   | 05 – Insufficient | 0  |

2224

# Chapter 19 - Reflection

2225

2226

## About

2227

2228 Reflection is an opportunity for you share with me, your professor, your thoughts about the Polimetrics  
2229 Chapter Assignments. No other student will read your reflection.

2230

## Estimated Time

2231

2232 An estimated 60-120 minutes is needed to complete this activity.

2233

## Instructions

2234

2235 Please write at least 5 sentences reflecting on the Polimetrics Chapter Assignments. To be clear, this  
2236 reflection should focus on the Polimetrics Chapter Assignments as a whole. This reflection should not be  
2237 about a specific chapter or another assignment.

2238 Sentence #1: Your 1st Sentence should be a question. Examples of questions include:

- 2239 • How can I apply the Polimetrics Chapter Assignments to my daily life or academic studies?
- 2240 • What did you find most interesting about the Polimetrics Chapter Assignments? Why did you  
2241 find this the most interesting?
- 2242 • What did you find most relevant to your daily life about the Polimetrics Chapter Assignments?  
2243 Why did you find this the most relevant?
- 2244 • You are welcome to ask and answer your own question.

2245 Sentence #2-5: Sentences 2 through 5 should be your response to the question you posed in sentence #1.

2246

## Rubric

2247

| Criteria                                       | Ratings        | Points |
|------------------------------------------------|----------------|--------|
| 1 <sup>st</sup> Sentence a Question            | Yes            | 25     |
|                                                | No             | 0      |
| Quantity: # Sentences                          | 4              | 75     |
|                                                | 3              | 60     |
|                                                | 2              | 45     |
|                                                | 1              | 30     |
